<i>Configure the AT-TLS policy</i>	15
<i>Activating the AT-TLS configuration</i>	37
<i>Summary</i>	42
<i>Appendix – AT-TLS Policy Agent Configuration File</i>	43

Important: At URL <https://ibm.box.com/v/WSC-AdminSecurity> there is a file named *Admin Security CopyPaste.txt*. This file contains commands and other text used in this workshop. Locate that file and open it. Download this file and use the copy-and-paste function (**Ctrl-C** and **Ctrl-V**) to enter commands or text. It will save time and help avoid typo errors. As a reminder text that appears in this file will be highlighted in yellow.

Note: Connectivity from the remote Desktop to this site is not always available. In this case, access this URL from your local Desktop and then copy the file from the local Desktop to the remote Desktop.

General Exercise Information and Guidelines

- ✓ This exercise requires the completion of the *IBM z/OS Connect Customization - Basic Configuration (1 of 2)* and *IBM z/OS Connect Customization -Basic Security (2 of 2)* exercises before it can be performed.
- ✓ This exercise requires using z/OS user identities *FRED* and *USER1*. The password for these users will be provided by the lab instructions.
- ✓ There are examples of *server.xml* scattered through this exercise. Your *server.xml* may differ depending on which exercises have been previously performed. Be sure the **red lines** in these examples are either added or already present.
- ✓ The acronyms RACF (resource access control facility) and SAF (*system authorization facility*) are used in this exercise. RACF is the IBM security manager product whereas SAF is a generic term for any security manager product, e.g. ACF2 or Top Secret or RACF. An attempt has been to use SAF when referring to information appropriate for any SAF product and to use RACF when referring to specific RACF commands or examples.
- ✓ Any time you have any questions about the use of IBM z/OS Explorer, 3270 screens, features or tools, do not hesitate to ask the instructor for assistance.
- ✓ Text in **bold** and highlighted in **yellow** in this document should be available for copying and pasting in a file named *Security CopyPaste* file on the desktop.
- ✓ Please note that there may be minor differences between the screen shots in this exercise versus what you see when performing this exercise. These differences should not impact the completion of this exercise.
- ✓ For information regarding the use of the Personal Communication 3270 emulator, see the *Personal Communications Tips* PDF in the exercise folder.

Overview

This exercise demonstrates the steps required to enable TLS security between an MVS batch region and a z/OS Connect server. TLS security between these two endpoints requires the use of AT-TLS (Application Transparent-TLS). This document is only intended to be an introduction to AT-TLS, not an all-encompassing description of what can be done by AT-TLS. Therefore, only a simple AT-TLS outbound policy will be used in this exercise. Hopefully performing this exercise will provide the foundation required to fully exploit AT-TLS in other scenarios.

- First the RACF resources, e.g. digital certificates, keyrings will be defined and configured.
- The exercise will begin by submitting an API requester batch application that invokes an API using HTTP. This is done to become familiar with the application.
- z/OSMF will then be used to configure a simple AT-TLS outbound policy.
- The AT-TLS policy will be activated and messages and traces etc. will be reviewed to confirm the policy has been installed.
- Finally, the client API requester batch application will be executed again showing how HTTPS is used to encrypt the message and provide an authentication identity.

Creating RACF resources

In this section, the required RACF resources will be created. Note that the digital certificates used by the batch client application were created in a previous exercise. Review member ZCEETLSS to see the commands used to create USER1's personal certificate and the certificate authority (CA) certificate used to sign the personal certificates used in this exercise.

- ___ 1. Browse data set *USER1.ZCEE30.CNTL*. You should see the members in that data set.
- ___ 2. Next browse member **MVSTLS**, you should see the RACF commands below. Submit the job for execution.

```
RACDCERT ID(USER1) ADDRING(Liberty.KeyRing)

RACDCERT ID(USER1) CONNECT(LABEL('USER1') +
    RING(Liberty.KeyRing) DEFAULT)

RACDCERT ID(USER1) CONNECT(CERTAUTH LABEL('Liberty CA') +
    RING(Liberty.KeyRing))

PERMIT IRR.DIGTCERT.LISTRING +
    CLASS(FACILITY) ID(USER1) ACCESS(READ)

PERMIT IRR.DIGTCERT.LIST +
    CLASS(FACILITY) ID(USER1) ACCESS(READ)

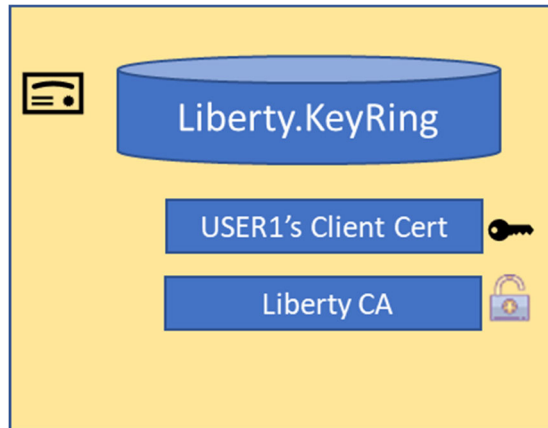

SETR RACLIST(DIGTCERT DIGTRING FACILITY) REFRESH
```

These commands

- Define a key ring for USER1
- Connect USER1's personal certificate (created earlier by job ZCEETLSS) to this key ring
- Connect the certificate authority (CA) public certificate used to sign USER1's personal certificate to this key ring.
- USER1 is given the required authority to access the key ring and certificate
- The in-storage profile for digital certificates resources are refreshed.

N.B. The same CA was used to sign the server certificate that will be sent by the z/OS Connect server this is the only CA certificate required on this key ring.

Below is visual representation of the key ring just created

Tech-Tip: In this example the digital certificates had been already present in the RACF data base. But if they had been provided by an external CA authority and stored in MVS data sets, they could have been added to RACF with these commands:

```
racdcert id(USER1) withlabel('USER1)  add('USER1.USER1.P12') password('secret')
racdcert CERTAUTH withlabel('Liberty CA')  add('USER1.LIBERTY.PEM')
```

3. Next browse member **ZCEETLSC**. You should see the RACF commands below. Submit the job for execution if this job has not been previously submitted in another exercise.

```
/* Create personal certificate for zCEE outbound client request */
racdcert id(libserv) gencert subjectsdn(cn('zCEE Client Cert') +
ou('ATS') o('IBM')) withlabel('zCEE Client Cert') signwith(certauth +
label('zCEE CA')) notafter(date(2022/12/31))

/* Create zCEE outbound key ring and connect certificates */
racdcert id(libserv) addring(zCEE.KeyRing)

racdcert id(libserv) connect(ring(zCEE.KeyRing) +
label('zCEE CA') certauth usage(certauth))

racdcert id(libserv) connect(ring(zCEE.KeyRing) +
label('Liberty CA') certauth usage(certauth))

/* Connect CA certificate to Liberty inbound key ring */
racdcert id(libserv) connect(ring(Liberty.KeyRing) +
label('zCEE CA') certauth usage(certauth))

/* Connect default personal certificate */
racdcert id(libserv) connect(ring(zCEE.KeyRing) +
label('zCEE Client Cert') default)

racdcert id(libserv) listring(zCEE.KeyRing)
racdcert id(libserv) list

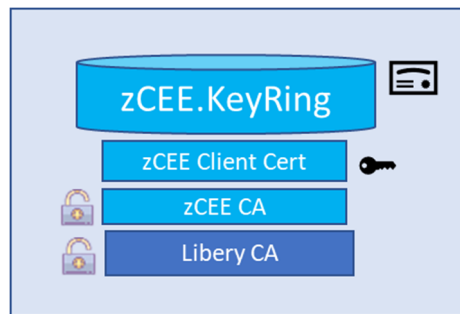

setr raclist(digtcert digtring) refresh

connect    libserv  group(zceeusrs)
connect    libserv  group(gminvoke)
```

These commands

- Define a personal certificate for the z/OS Connect server for use during outbound handshakes
- Define a key ring to be used for outbound handshakes
- Connect the z/OS Connect server personal certificate to this key ring
- Connect the CA public certificate used to sign the z/OS Connect server's outbound personal certificate to this key ring.
- Connect the CA public certificate used to sign the API provider server's certificate to this key ring.
- Connects the CA public certificate used to sign the z/OS Connect server's outbound personal certificate to the API provider's key ring
- User LIBSERV is given the required authority to access their key ring and certificate
- The in-storage profile for digital certificates resources are refreshed.
- User LIBSERV is connected to the groups that provide access to this z/OS Connect instance.

Below is visual representation of the key ring just created

4. Edit the *server.xml* configuration file for the *myServer* server found in directory */var/zosconnect/servers/myServer* and change the include for *keyringMutual.xml* to an include of *keyringOutboundMutua.xml* (see below) and add include statements for *ipicIDProp.xml*, *apiRequesterHTTPS.xml* and *shared.xml*, see below:

```
<include location="/${server.config.dir}/ipicIDProp.xml"/>
<include location="/${server.config.dir}/keyringOutboundMutual.xml"/>
<include location="/${server.config.dir}/apiRequesterHTTPS.xml"/>
<include location="/${server.config.dir}/shared.xml"/>
```

These include statement may not be required if another exercise has already been performed this action.

```
<include location="/${server.config.dir}/safSecurity.xml"/>
<include location="/${server.config.dir}/ipicIDProp.xml"/>
<include location="/${server.config.dir}/keyringOutboundMutual.xml"/>
<include location="/${server.config.dir}/apiRequesterHTTPS.xml"/>
<include location="/${server.config.dir}/groupAccess.xml"/>
<include location="/${server.config.dir}/shared.xml"/>
```

5. Stop and restart the server with MVS commands **P BAQSTRT** and **S BAQSTRT**.

Tech-Tip: MVS and JES2 commands can be entered from SDSF by enter a / (slash) on the command line followed by the command itself (e.g. /D T). The command results can be found in the system log. If a command is especially long, then simply entering a / (slash) to display a *SDSF – System Command Extension* panel where a command can span multiple lines. When an MVS command must be entered, the instructions in these exercises will indicate that the command is an MVS command. MVS commands can be enter at the prompt by using the / (slash) prefix or using the *SDSF – System Command Extension* panel.

N.B. the contents of *keyringOutboundMutual.xml*

```
<!-- Enable features -->
<featureManager>
  <feature>transportSecurity-1.0</feature>
</featureManager>

<sslDefault sslRef="DefaultSSLSettings"
  outboundSSLRef="OutboundSSLSettings" />

<ssl id="DefaultSSLSettings"
  keyStoreRef="CellDefaultKeyStore"
  trustStoreRef="CellDefaultKeyStore"
  clientAuthenticationSupported="true"
  clientAuthentication="true"/>

<keyStore id="CellDefaultKeyStore"
  location="safkeyring:///Keyring.LIBERTY"
  password="password" type="JCERACFKS"
  fileBased="false" readOnly="true" />

<ssl id="OutboundSSLSettings"
  keyStoreRef="OutboundKeyStore"
  trustStoreRef="OutboundKeyStore"/>

<keyStore id="OutboundKeyStore"
  location="safkeyring:///zCEE.KeyRing"
  password="password" type="JCERACFKS"
  fileBased="false" readOnly="true" />
```

Test the connection from the batch job to the z/OS Connect server

The JCL to execute the batch client can be found in *USER1.ZCEE30.CNTL*, the member name is *GETAPI*.

- ___ 1. Submit the job in member **GETAPI** in *USER1.ZCEE30.CNTL*.
- ___ 2. It should complete with a return code of 5. The job's return code was derived from the value of the *BAQ-ERROR-IN-STUB* field. This return code indicated that the attempt to communicate with the z/OS Connect server using the z/OS client web enablement toolkit (HWT) failed.

Error code: 0000000005
 Error msg:BAQI0005E: Unable to send request to or receive response from the z/OS Connect EE server.HWTHRQST RC=262(0x106) RSC=6 RSN=A redirect status was returned but no redirect location was provided.

The explanation for the HWTHRQST return code is shown below,

https://www.ibm.com/support/knowledgecenter/SSLTBW_2.4.0/com.ibm.zos.v2r4.ieac100/HWTHRQST.htm

106 HWTH_COMMUNICATION_ERROR	<table><tr><th>Meaning</th></tr><tr><td><p>A communication error has been detected. One or more of the following problems has occurred:</p><ul style="list-style-type: none">• A failure in the communication with the web server• An error in an underlying sockets or SSL/TLS service call• An error processing the HTTP request or the response coming back from the web server• An error in the translation of the data into the proper code page• An error in obtaining the necessary system resources to process the request.</td></tr></table>	Meaning	<p>A communication error has been detected. One or more of the following problems has occurred:</p> <ul style="list-style-type: none">• A failure in the communication with the web server• An error in an underlying sockets or SSL/TLS service call• An error processing the HTTP request or the response coming back from the web server• An error in the translation of the data into the proper code page• An error in obtaining the necessary system resources to process the request.
Meaning			
<p>A communication error has been detected. One or more of the following problems has occurred:</p> <ul style="list-style-type: none">• A failure in the communication with the web server• An error in an underlying sockets or SSL/TLS service call• An error processing the HTTP request or the response coming back from the web server• An error in the translation of the data into the proper code page• An error in obtaining the necessary system resources to process the request.			

There is a simple explanation on why this error occurred. The z/OS Connect server was configured to require all client requests use HTTPS (*requireSecure="true"*) for communications. When the request from the batch job arrived, the server attempted to redirect the inbound request to a HTTPS port. Since the batch job did not have support for SSL, the redirect request failed (HTTP code 302),

- ___ 3. To test a non-TTL connection, the HTTPS security requirement for the *cscvincapi_1.0.0* API requester needs to be turned off temporarily. Edit file *apiRequesterHTTPS.xml* and change *requireSecure* attribute of the *cscvincapi_1.0.0 apiRequester* element to **false** as shown below. This disables the requirement for inbound HTTPS traffic for this specific API requester element.

```
<zoscconnect_apiRequesters location="/var/zcee/shared/apiRequesters"
  idAssertion="ASSERT_ONLY">
  <apiRequester name="cscvincapi_1.0.0" requireSecure="false" />
</zoscconnect_apiRequesters>
```

- ___ 4. Activate this change by entering MVS command **F BAQSTR,REFRESH,CONFIG**

___ 5. Submit the job in member **GETAPI** in *USER1.ZCEE30.CNTL*.

```
//USER1GET JOB MSGCLASS=H,NOTIFY=&SYSUID,USER=USER1
//GETAPI EXEC PGM=GETAPI,PARM='111111'
//GETAPI EXEC PGM=GETAPI,PARM='111111'
//STEPLIB DD DISP=SHR,DSN=USER1.ZCEE30.LOADLIB
// DD DISP=SHR,DSN=ZCEE30.SBAQLIB
//SYSPRINT DD SYSOUT=*
//CEEOPPTS DD *
    POSIX(ON),
    ENVAR("BAQURI=wg31.washington.ibm.com",
    "BAQPORT=9080",
    "BAQUSERNAME=USER1",
    "BAQPASSWORD=USER1")
```

___ 6. The job should complete with a condition code of 200 and have the following output for SYSPRINT.

```
NUMB: 111111
NAME: C. BAKER
ADDRX: OTTAWA, ONTARIO
PHONE: 51212003
DATEX: 26 11 81
AMOUNT: $0011.00
EIBRESP: 00000000
EIBRESP2: 00000000
USERID: LIBSERV
HTTP CODE: 0000000200
```

7.

Tech-Tip: An HTTP code of 200 indicates success. For an explanation of HTTP codes see [URL https://en.wikipedia.org/wiki/List_of_HTTP_status_codes](https://en.wikipedia.org/wiki/List_of_HTTP_status_codes).

Tech-Tip: The value of the *USERID* will vary depending upon whether *ipic.xml* or *ipicIDProp.xml* is included in the server.xml. When *ipic.xml* is included, the CICS default user identity is used to execute the CICS program. When *ipicIDProp.xml* is included, the identity mapped to the client digital certificate is propagated to CICS for CICS authorization checks.

___ 7. Change the PARM='111111' to PARM='000000' and resubmit. This time the output should look something like this:

```
Error code: 0000000404
Error
msg:{"cscvincServiceOperationResponse":{"Container1":{"RESPONSE_CONTAINER":
{"CEIBRESP2":80,"FILEA_AREA":{"STAT":""
,"ADDRX":"","AMOUNT":"","PHONE":"","DATEX":"","NUMB":"000000","COMMENT":"","
,"NAME":""},"ACTION":"S","USERID":"LIBSERV","
CEIBRESP":13}}}}
```

The CEIBRESP and CEIBRESP2 values are from a CICS program (a CICS program is the ultimate target of the API provider) and the response codes received is returned when an EXEC CICS READ fails with a *Not Found* (EIBRESP 13, EIBRESP2 80) condition.

The available records are listed below:

numb	name	addrx	Phone	datex	amount
000100	S. D. BORMAN	SURREY, ENGLAND	32156778	26 11 81	\$0100.11

888888	P. MUNDY	NORTHAMPTON, ENG.	23691639	26 11 81	\$0038.00
900000	D.S. RENSHAW	TAMPA, FLA.	35668120	26 11 81	\$0040.00
999999	ANJI STEVENS	RALEIGH, N.Y.	84591639	26 11 81	\$0049.00

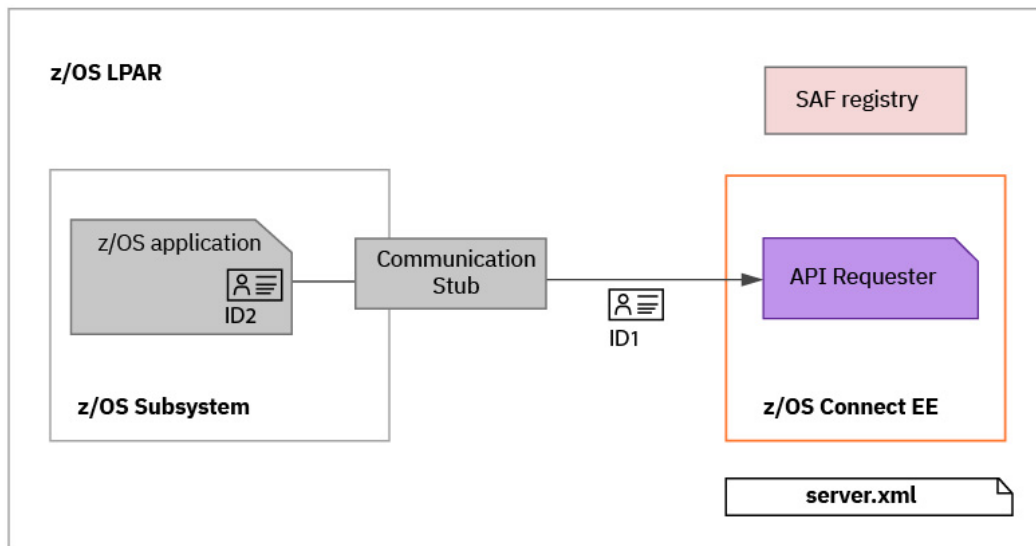

8. Change the *PARM=* value back to '*IIIIII*' or some other valid value and change the *USER* value on the job card to *USER2*, e.g. *USER=USER2*. Resubmit the job with the new user value. This time the job should fail with a return code of 403. An HTTP 403 indicates the request is *Forbidden*.

Error code: 0000000403

Error msg:{"errorMessage":"BAQR7115E: The asserted user ID USER2 is not authorized to invoke the API requester on resource /zosConnect/apiRequesters/cscvincapi_1.0.0."}

Tech-Tip: USER2 is not a member of either group GMADMIN or GMINVOKE.

This is demonstrating API requester security as shown in the z/OS Connect Knowledge Center, https://www.ibm.com/support/knowledgecenter/SS4SVW_3.0.0/securing/requester_id_assertion.html

Referencing the above diagram. For MVS Batch (or for an IMS BMP) the value for *ID1* is the identity under which is the job executes. This identity is specified by the value of the *USER* parameter on the job card or defaults to the user submitting the job. The value for *ID2* is the value of the *BAQUSERNAME* environment variable.

Now explore the security implications for *ID2*.

9. Change the *USER* parameter on the job card to **USER1** and change the value for *BAQPASSWORD* to any other value, e.g. password. Resubmit the job for execution. This time the job should fail with a return code of 401. An HTTP 401 indicates the request is *Unauthorized*.

```
Error code: 0000000401
Error msg: Unauthorized
```

Tech-Tip: This will be accompanied by these messages in the SYSLOG and the JES messages of the server's started task.

```

ICH408I USER(USER1 ) GROUP(SYS1 ) NAME(WORKSHOP USER1 )
LOGON/JOB INITIATION - INVALID PASSWORD
IRR013I VERIFICATION FAILED. INVALID PASSWORD GIVEN.
ICH408I USER(USER1 ) GROUP(SYS1 ) NAME(WORKSHOP USER1 )
LOGON/JOB INITIATION - INVALID PASSWORD I
IRR013I VERIFICATION FAILED. INVALID PASSWORD GIVEN.
    
```

RACF authentication failed because the provided password is invalid. .

- ___ 10. Change the value for *BAQUSERNAME* to **USERX**. Resubmit the job for execution. This time the job should fail with a return code of 401.

Error code: 0000000401
Error msg:Unauthorized.

Tech-Tip: This will be accompanied by these messages in the SYSLOG.

```

IRR012I VERIFICATION FAILED. USER PROFILE NOT FOUND.
IRR012I VERIFICATION FAILED. USER PROFILE NOT FOUND.
    
```

RACF authentication failed because the provided ID2 identity is not known in RACF.

- ___ 11. Reenable TLS security for the *cscvinc_1.0.0* by editing the *apiRequesterHTTPS.xml* and changing *requireSecure* attribute of the *cscvincapi_1.0.0 apiRequester* element to **true** as shown below. This require all inbound request for this API requester to use HTTPS.

```

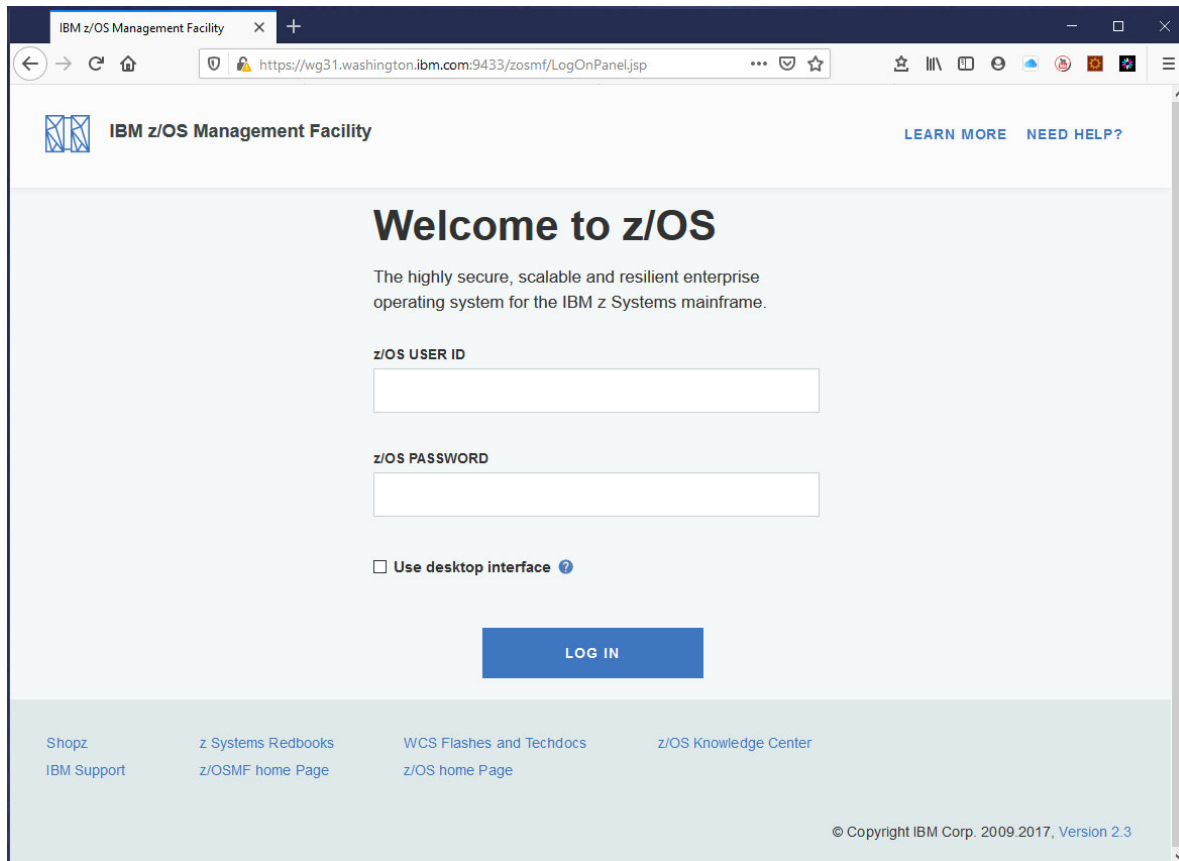

<zoscconnect_apiRequesters location="/var/zcee/shared/apiRequesters"
  idAssertion="ASSERT_ONLY">
  <apiRequester name="cscvincapi_1.0.0" requireSecure="true" />
</zoscconnect_apiRequesters>
    
```

- ___ 12. Activate this change by entering MVS command **F BAQSTRT,REFRESH,CONFIG**

Configure the AT-TLS policy

z/OSMF will be used in this section to configure the AT-TLS configuration for the desired outbound policy.

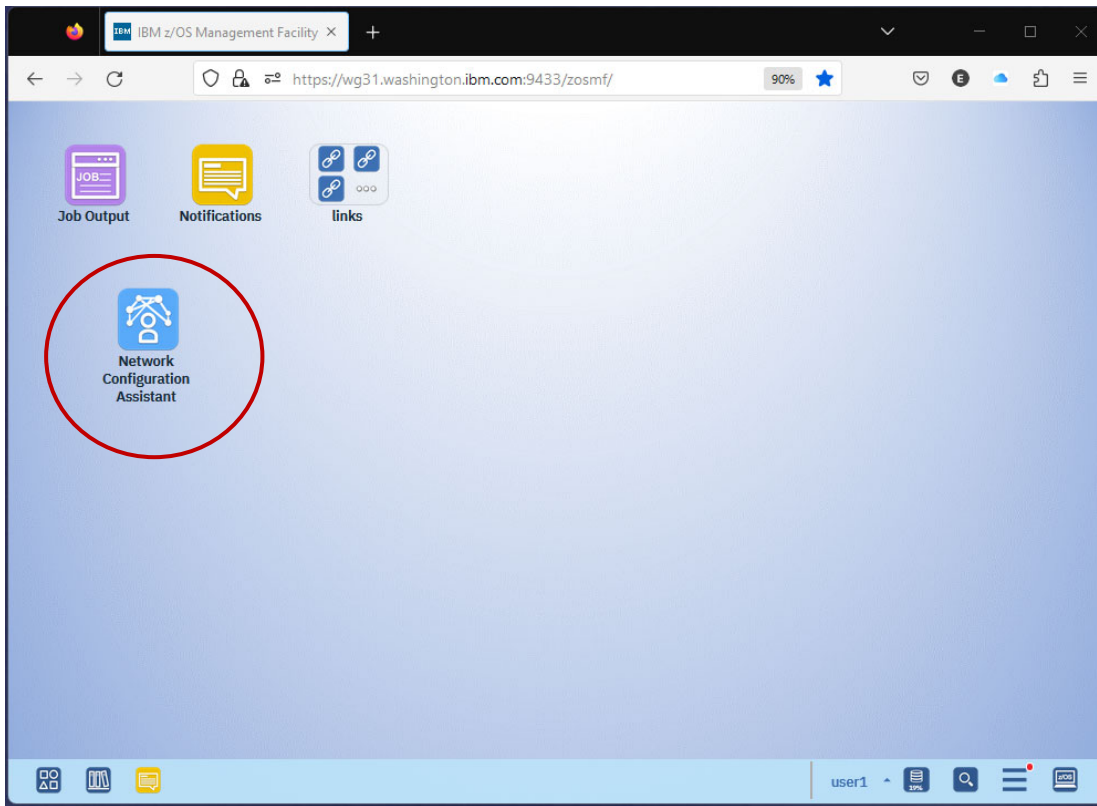

1. In a Firefox browser enter URL <https://wg31.washington.ibm.com:9433/zosmf> in the Firefox browser and you should see the *IBM z/OS Management Facility* window.

Note that some of the AT-TLS configurations steps described here may have been performed in another exercise.

2. Enter *USER1* as the *z/OS USER ID* and *USER1*'s password and click the **LOG IN** button.

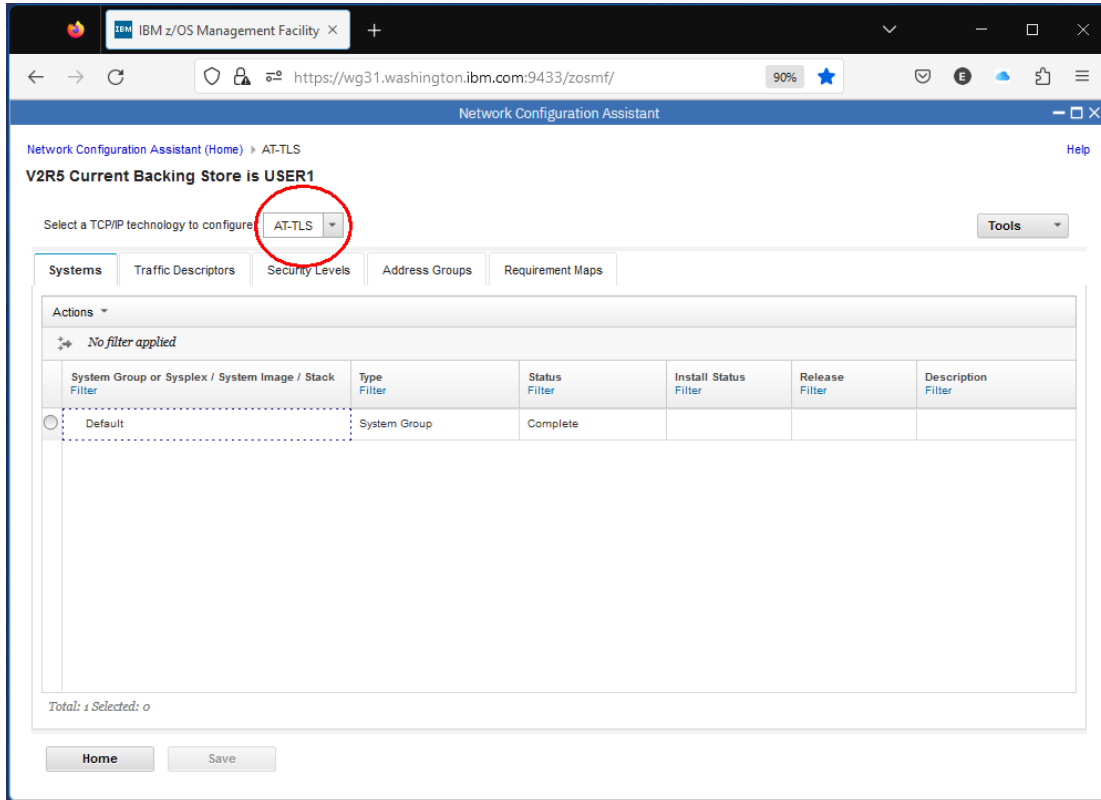

- ___ 3. On the initial zOSMF panel, select the *Network Configuration Assistant* by double clicking on the icon labeled *Network Configuration Assistant*.

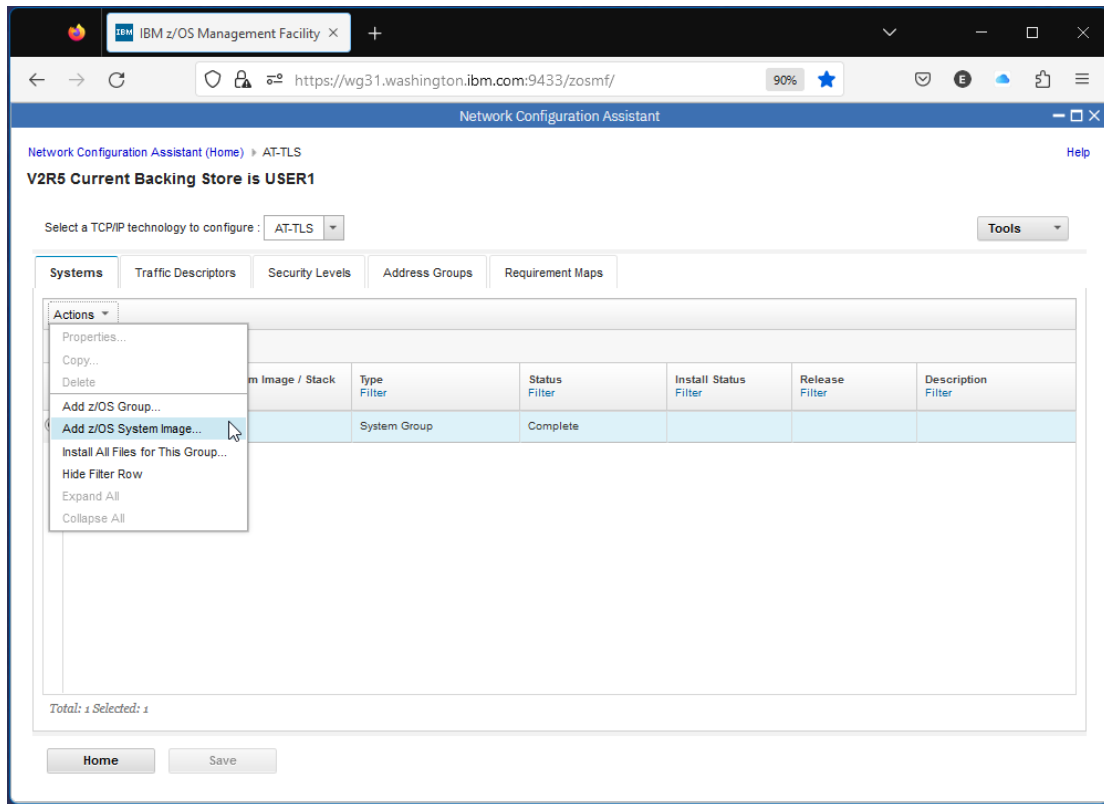

Tech-Tip: Subsequent screen shot show the *Network Configuration Assistance* expanded to fill the browser screen.

- ___ 4. Select the radio button beside *Create or transfer a new backing store* option and click the **Proceed** button.
- ___ 5. On the next screen select the radio button beside *Create a New Backing Store File* and enter **USER1** in the area beside *File Name*. Press the **OK** button and press the **OK** button on the Information pop-up.

6. On the *Network Configuration* tab use the pull-down arrow to select *AT-TLS* as the *TCP/IP technology to configure*.

7. Select the radio button beside the *Default - System Group* and use the *Action* pull-down button to select *Add z/OS System Image* option.

8. On the *Add z/OS System Image* window enter **WG31** for the image *Name* and check the radio button beside *Simple name (as in an SAF product...)* and enter **Liberty.KeyRing** as the default AT-TLS key ring name. Click **OK** to continue.

The screenshot shows the 'Add z/OS System Image' window in the IBM z/OS Management Facility. The 'Name' field is populated with 'WG31'. The 'z/OS Release' dropdown menu shows 'V2R5'. In the 'Default AT-TLS key ring database' section, the radio button for 'Simple name (as in an SAF product or in PKCS #11 token format)' is selected, and the 'Key ring' field is filled with 'Liberty.KeyRing'. The 'OK' and 'Cancel' buttons are visible at the bottom of the window.

Tech Tip: The value for the key ring will be used if an explicit key ring is not provided for a policy.

We recommend establishing a naming convention for key rings with each SAF identity using the same key ring name in the same context. Using this name as an example you could create a unique key ring named *Liberty.KeyRing* for SAF identities USER1, USER2, FRED, etc. Each user's key ring would have the same name but a different set of connected certificates. One default key ring specified at the image level covers all users.

9. On the *Proceed to the Next Step?* pop-up click the **Proceed** button.

10. The *Add TCP/IP Stack* screen should be displayed. Select this option to expose the *Network Configuration* tab. Enter **TCPIP** as the name of the stack. Click **OK** to continue.

The screenshot shows a web browser window titled "IBM z/OS Management Facility" with the URL "https://wg31.washington.ibm.com:9433/zosmf/". The page is titled "Network Configuration Assistant" and shows the "Add TCP/IP Stack" screen. The "Name" field is filled with "TCPIP". The "Description" field is empty. There are "OK" and "Cancel" buttons at the bottom.

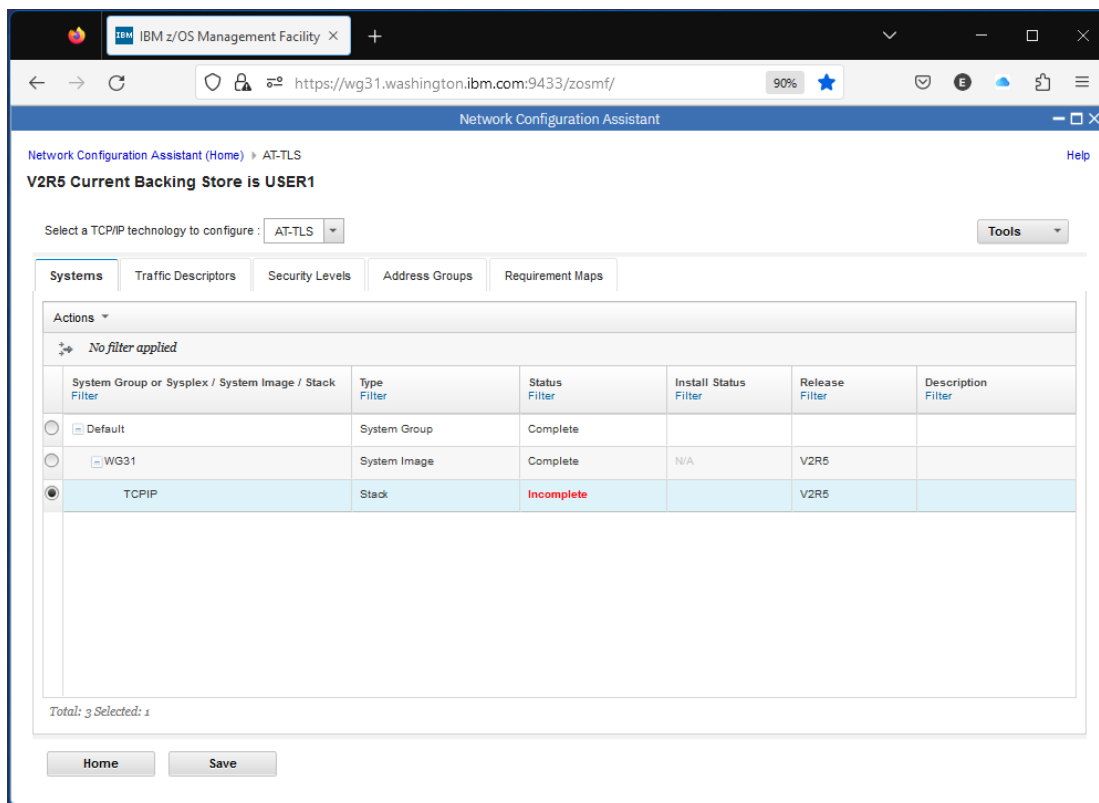

Tech-Tip: The value for the stack name was determined by the TCPIP Name display by entering the MVS command D TCPIP.

```
EZAOP50I TCPIP STATUS REPORT 007
COUNT   TCPIP NAME   VERSION   STATUS
-----
      1   TCPIP       CS V2R5   ACTIVE
*** END TCPIP STATUS REPORT ***
EZAOP41I 'DISPLAY TCPIP' COMMAND COMPLETED SUCCESSFULLY
```

11. Before any TCP/IP stack rules can be added, *Traffic Descriptors*, *Address Groups* and *Requirement Maps* need to be defined. Click **Cancel** on the *Proceed to the Next Step?* displayed at this time.

12. This will display the window below:

Tech Tip: The **Incomplete** warning will be addressed shortly.

13. Select the radio button beside *WG31* and use the *Actions* pull-down to select *Properties*. On the *Modify z/OS System Image* window select the *System Image Level Settings* tab and check all the trace level boxes as shown below. This is being done so we can confirm AT-TLS is being invoked and identify issues. Press **OK** to continue.

IBM z/OS Management Facility

Network Configuration Assistant

Network Configuration Assistant (Home) > AT-TLS > z/OS System Image

Modify z/OS System Image

General System Image Level Settings Advanced LDAP HTTP OCSP CRL Advanced

Default AT-TLS key ring database

☒ Simple name (as in an SAF product or in PKCS #11 token format)

* Key ring:

Liberty.KeyRing

☐ Key database is a z/OS UNIX file system file:

* Key database:

☐ * Key database stash file:

or

☐ * Key database password:

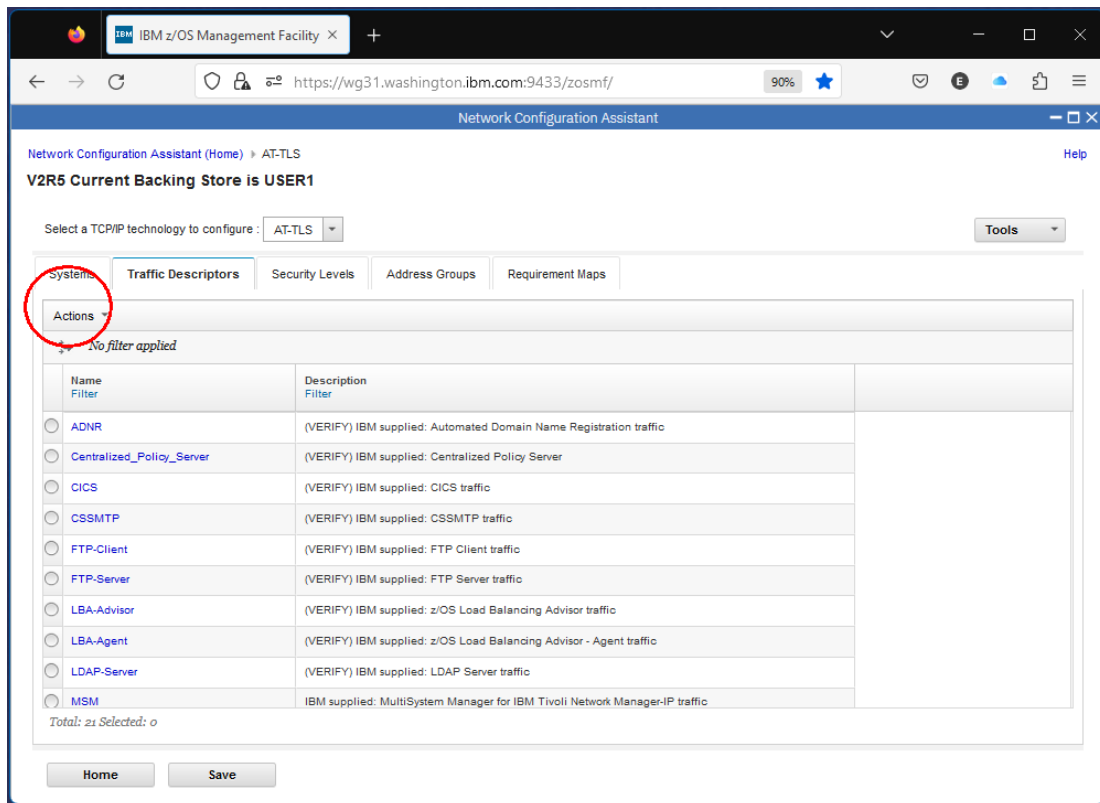

Reaccess Key Rings

Default AT-TLS trace level

☒ Level 1 - Errors (to TCP/IP joblog) ☒ Level 2 - Errors (to syslog) ☒ Level 4 - Information (to syslog)

OK Cancel

14. Select the *Traffic Descriptors* tab and use the *Actions* pull-down to select *New*.

15. On the *New Traffic Descriptor* window enter **zCEEClient** as the name and use the *Actions* pull-down and select *New* to start the definition of a new traffic descriptor type.

Network Configuration Assistant (Home) > AT-TLS > Traffic Descriptor

New Traffic Descriptor

Traffic descriptors contain details of traffic types which are mapped to security levels within requirement maps. A traffic descriptor can contain a single type of traffic or multiple types of traffic.

* Name:

Description:

List of traffic types in this traffic descriptor

Protocol	Local Port	Remote Port	Connect Direction	Job Name	User ID
There is no data to display.					

Total: 0 Selected: 0

OK Cancel

16. On the *New Traffic Type – TCP* window select the radio button beside *Ephemeral ports* under *Local port*. Select the radio button *Single port* under *Remote port* and enter **9443** as the port number. Select the radio button beside *Outbound only* under *Indicate the TCP connection direction*. Enter **USERIGET** in the area under *Jobname* and finally select the radio button beside *Client* under *AT-TLS Handshake Role*. Click **OK** to continue.

The screenshot shows the 'New Traffic Type - TCP' configuration window in the IBM z/OS Management Facility. The 'Details' tab is selected. The 'Local port' section has 'Ephemeral ports' selected. The 'Remote port' section has 'Single port' selected with the value '9,443'. The 'Indicate the TCP connect direction' section has 'Outbound only' selected. The 'Jobname' field contains 'USERIGET'. The 'AT-TLS Handshake Role' section has 'Client' selected.

Tech-Tip: This traffic definition is triggered when job name *USERIGET* running on the local TCP/IP stack opens a temporary or ephemeral port and tries to connect to port 9443, e.g. *outbound*. A further requirement could be to require that SAF identity associated with the job be a specific value. If all the defined conditions are met, AT-TLS will act as a surrogate for the client during a TLS handshake. Note the *KeyRing* tab can be used to specify the name of the key ring to be used for this handshake. Otherwise the default is to use the same key ring name defined for the z/OS System image, e.g. *Liberty.KeyRing*.

Tech Tip: The key ring specified here belongs to identity USER1. This is the identity under which the MVS batch job is running. This ring has these certificates connected.

Ring:

```
>Liberty.KeyRing<
Certificate Label Name      Cert Owner      USAGE      DEFAULT
-----
Liberty CA                 CERTAUTH       CERTAUTH   NO
USER1                     ID (USER1)     PERSONAL   YES
```

The TLS handshake will be performed with the z/OS Connect Liberty server using the key ring owned by identity LIBSERV which has been configured for inbound JSSE connections. Both personal certificates were signed by the same Certificate Authority.

Ring:

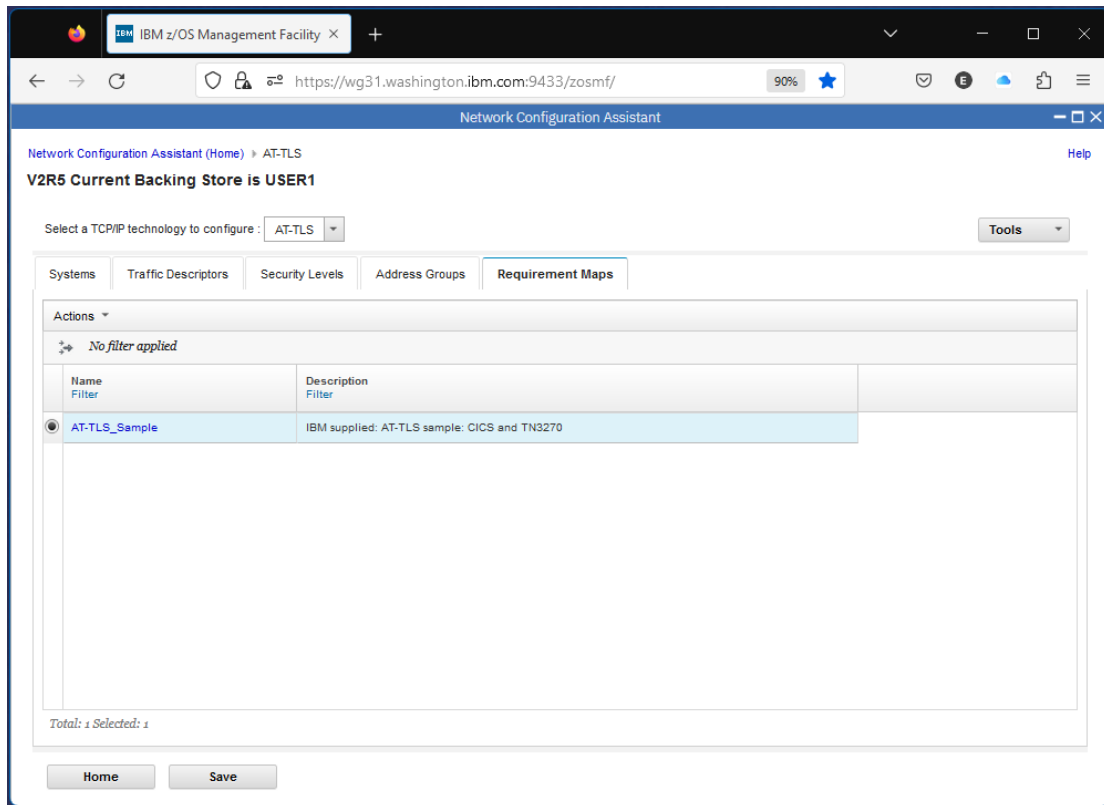

```
>Liberty.KeyRing<
Certificate Label Name      Cert Owner      USAGE      DEFAULT
-----
Liberty Client Cert       ID (LIBSERV)    PERSONAL   YES
Liberty CA                 CERTAUTH       CERTAUTH   NO
zCEE CA                    CERTAUTH       CERTAUTH   NO
```

___17. Click **OK** when the *New Traffic Descriptor* window is redisplayed.

18. Next click the Security Levels tab and use the *Actions* pull-down button and to select the *New* option. On the *New Security Level* windows, enter **zCEESecurity** for the *Name* and check the box beside *TLS V1.3*. Click **Next** to display the *Cipher selection* options. Click **Next** to display the *Advanced Settings* options exploring as you like but there is no need to make any changes. Click **Finish** to continue.

The screenshot shows the IBM z/OS Management Facility Network Configuration Assistant interface. The browser address bar displays `https://wg31.washington.ibm.com:9433/zosmf/`. The page title is "Network Configuration Assistant". The breadcrumb navigation shows "Network Configuration Assistant (Home) > AT-TLS > Security Level". The main heading is "New Security Level". On the left sidebar, there are three tabs: "Name" (selected), "Ciphers", and "Advanced Settings". The "Name" tab contains a lock icon, a text input field for "Name" with the value "zCEESecurity", and a text input field for "Description". Below this, the "Version choices" section lists several options with checkboxes: "TLS V1.3 (Available beginning with z/OS V2R4)" (checked), "TLS V1.2" (checked), "TLS V1.1" (unchecked), "TLS V1.0 (not recommended)" (unchecked), and "SSL V3 (not recommended)" (unchecked). At the bottom of the window, there are four buttons: "< Back", "Next >", "Finish", and "Cancel".

19. Next click the *Requirement Maps* tab. Use the *Actions* pull-down button and to select the *New* option.

20. On the *New Requirement Map* window enter **zCEERequirementMap** as the *Name* and use the pull-down arrows to select **zCEEClient** as the *Traffic Descriptor* and **zCEESecurity** as the *Security Level* for this map. Click **OK** to continue.

Network Configuration Assistant (Home) > AT-TLS > Requirement Map

New Requirement Map

A requirement map is an object that maps each IP traffic type (traffic descriptor) to a specific level of security (security level).

To add a new mapping to the requirement map:

1. Click the "Add Row" action or use an existing row
2. Click a table cell to select a traffic descriptor from the list
3. Click a table cell to select a security level from the list

* Name: zCEERequirementMap

Description:

Mappings table

Traffic Descriptor	Security Level
zCEEClient	zCEESecurity

Total: 3 Selected: 0

OK Cancel

21. Select the radio button beside *zCEERequirementMap* and use the *Actions* pull-down to select the *View Details* options to display the window below. Review the details and click the **Close** button to continue.

The screenshot shows the IBM z/OS Management Facility Network Configuration Assistant interface. The browser address bar displays `https://wg31.washington.ibm.com:9433/zosmf/`. The page title is "Network Configuration Assistant". The breadcrumb navigation shows "Network Configuration Assistant (Home) > AT-TLS > View Details".

Close Back to Top

22. Click the **Save** button to save the configuration.

23. When the save has completed, click on the *Systems* tab to return to this window.

24. Select the radio button beside *TCPIP* and use the *Actions* pull-down to select *Rules*. This is where these definitions will be tied together. Use the *Actions* pull-down and select *New* to create a new connectivity rule. Enter **zCEEClientRule** for the *Connectivity rule name* and press **Next** to continue.

The screenshot shows the 'Network Configuration Assistant' window. The breadcrumb trail is 'Network Configuration Assistant (Home) > AT-TLS > TCP/IP Stack > Connectivity Rule'. The page title is 'New Connectivity Rule'. On the left, there is a sidebar with 'Data Endpoints' selected, and sub-links for 'Requirement Map' and 'Advanced Settings'. The main content area is titled 'Data Endpoints'. It contains a form with the following fields:

- '* Connectivity rule name:' with a text box containing 'zCEEClientRule'.
- 'Select the address groups of the host endpoints of the traffic you want to protect.'
- 'Local data endpoint' section with two radio buttons:
 - 'Address group:' (selected) with a dropdown menu showing 'All IPv4_Addresses'.
 - '* IPv4 or IPv6 address, subnet, or range:' (unselected) with a text box and examples: 'x.x.x.x, x.x.x.x/yy, x.x.x-x.y.y.y, x:x, x:x/yyy, x:x-y:y'.
- 'Remote data endpoint' section with two radio buttons:
 - 'Address group:' (selected) with a dropdown menu showing 'All IPv4_Addresses'.
 - '* IPv4 or IPv6 address, subnet, or range:' (unselected) with a text box and examples: 'x.x.x.x, x.x.x.x/yy, x.x.x-x.y.y.y, x:x, x:x/yyy, x:x-y:y'.

At the bottom of the form are four buttons: '< Back', 'Next >', 'Finish', and 'Cancel'.

25. On the *New Connectivity Rule – Requirement Map* window select the radio button beside *Select an existing requirement map* and use the pull-down to select *zCEERequirementMap*. This should automatically populate the mapping table with *zCEEClient* as the traffic descriptor and *zCEESecurity* as the security level. Press **Next** and then **Finish** to continue.

Network Configuration Assistant (Home) > AT-TLS > TCP/IP Stack > Connectivity Rule

< Back Next > Finish Cancel

- ___ 26. Press **Close** to return to this window. Note that the status of the configuration is now complete (but never installed).

- ___ 27. Select the radio button beside *TCPIP* and use the *Actions* pull-down to select *Install All Files for This Group*.

28. On the *List of Configuration Files for All Systems Images in Group Default* window, select *WG31* and use the *Actions* pull-down to select *Install*.

29. On the *Install File for Default.WG31.TCPIP1* window click the **GO** button to continue.

30. Click **OK** twice to continue.

31. Next click on *AT-TLS* as shown below to return to the primary window.

32. The AT-TLS configuration has been completed and is installed. But not active yet.

Activating the AT-TLS configuration

The AT-TLS configuration has been saved in an OMVS file but has not been installed in the active policy agent task (e.g. PAGENT).

- ___ 1. This instance of the policy agent has been configured to use the *SYSLOGD* daemon task to log messages

```
//PAGENT EXEC PGM=PAGENT,REGION=0K,TIME=NOLIMIT,
//  PARM='ENVAR("_CEE_ENVFILE_S=DD:STDENV")/ -I SYSLOGD'
```

- ___ 2. The *SYSLOGD* daemon has been configured to write all log messages to file */var/syslogd/syslogall.log* (see the *syslog.conf* file in the */etc* subdirectory).

```
#####
#
# Write all messages with priority err and higher to log file errors.
#
#*.err                /var/log/%Y/%m/%d/errors
*. *                  /var/syslogd/syslogall.log
#
```

- ___ 3. Use ISPF option 3.4 to access directory */var/syslogd* and the *v* line command to view *syslogall.log*. Go to the bottom of the file and you will something like what is shown below:

```
WG31
File Edit Settings View Communication Actions Window Help

003529 Processing TLS rule 'zCEEClientRule~1'
```

- ___ 7. Go the bottom of this file and you see these messages.

```
EZD1579I PAGENT POLICIES ARE NOT ENABLED FOR TCPIP1 : TLS
EZZ8771I PAGENT CONFIG POLICY PROCESSING COMPLETE FOR TCPIP1 : QOS
EZZ8771I PAGENT CONFIG POLICY PROCESSING COMPLETE FOR TCPIP1 : TLS
EZD1586I PAGENT HAS INSTALLED ALL LOCAL POLICIES FOR TCPIP1
Finished main config file update
```

Tech-Tip: If a policy or otherwise changed the new or updated policy can be installed with an MVS modify command, *F PAGENT,REFRESH*

8. The policy agent is active. The policies have been loaded, but there is one remaining step. The TCPIP stack has not been modified to enable TTLS. AT-TLS has been configured on this image so is disabled by default and must be explicitly enabled. This is done by using an MVS *VARY* command,

V TCPIP,,OBEY,SYS1.TCPPARMS(TTLS)

Where the contents of SYS1.TCPPARMS(TTLS) is simply: TCPCONFIG TTLS.

When you issue this command, you should see these messages in the console log.

```
V TCPIP,,OBEY,SYS1.TCPPARMS(TTLS)
EZZ0060I PROCESSING COMMAND: VARY TCPIP,,OBEY,SYS1.TCPPARMS(TTLS)
EZZ0300I OPENED OBEYFILE FILE 'SYS1.TCPPARMS(TTLS)'
EZZ0309I PROFILE PROCESSING BEGINNING FOR 'SYS1.TCPPARMS(TTLS)'
EZZ0316I PROFILE PROCESSING COMPLETE FOR FILE 'SYS1.TCPPARMS(TTLS)'
EZZ0053I COMMAND VARY OBEY COMPLETED SUCCESSFULLY
```

Tech-Tip: AT-TLS can be also be disabled with a VARY command, *V TCPIP,,OBEY,SYS1.TCPPARMS(NOTTLS)* where the contents of SYS1.TCPPARMS(NOTTLS) is TCPCONFIG NOTTLS

9. Edit member **GETAPI** in *USER1.ZCEE30.CNTL*, change the port to 9443 and be sure the PARM is set to 111111. Submit the job for execution.

```
//GETAPI EXEC PGM=GETAPI,PARM='111111'
//STEPLIB DD DISP=SHR,DSN=USER1.ZCEE30.LOADLIB
// DD DISP=SHR,DSN=ZCEE30.SBAQLIB
//SYSPRINT DD SYSOUT=*
//CEEOPTS DD *
  POSIX(ON),
  ENVAR("BAQURI=wg31.washington.ibm.com",
  "BAQPORT=9443",
  "BAQUSERNAME=USER1",
  "BAQPASSWORD=USER1")
```

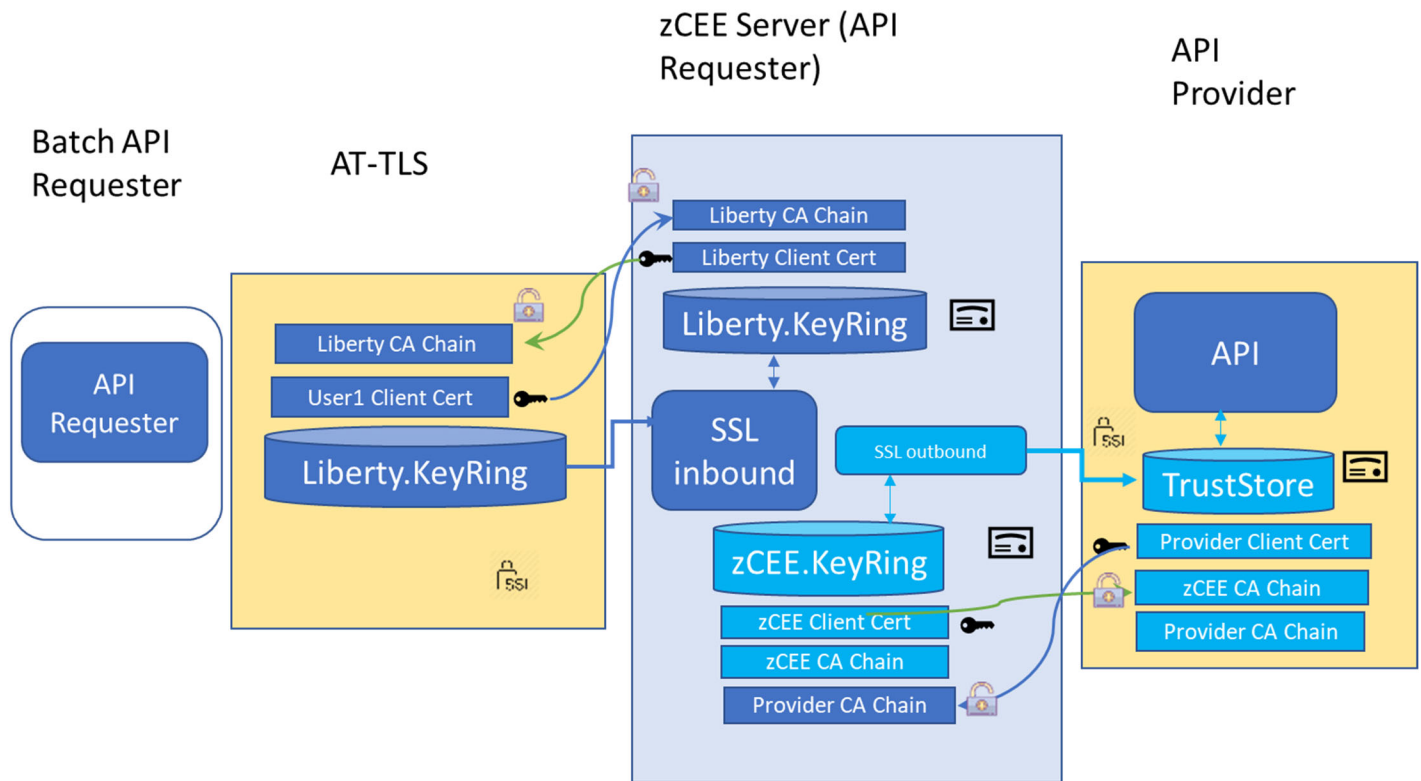

___10. It should complete with a return code 200 with the record displayed as before.

```
NUMB: 111111  
NAME: C. BAKER  
ADDRX: OTTAWA, ONTARIO  
PHONE: 51212003  
DATEX: 26 11 81  
AMOUNT: $0011.00  
EIBRESP: 00000000  
EIBRESP2: 00000000  
USERID: LIBSERV  
HTTP CODE: 0000000200
```

Tech-Tip: The value of the *USERID* will vary depending upon whether *ipic.xml* or *ipicIDProp.xml* is included in the server.xml. When *ipic.xml* is included, the CICS default user identity is used to execute the CICS program. When *ipicIDProp.xml* is included, the identity mapped to the client digital certificate is propagated to CICS for CICS authorization checks.

11. The results raise a question. Why is the user identity *LIBSERV* and not *USER1*? For an explanation see below.

The diagram below shows the identity that flows from the API requester. The API requester identity does not flow to the API provider. Since it is an TLS connection and mutual authentication being enabled, the RACF identity mapped to the z/OS Connect server client certificate (*LIBSERV*) is used for authorization checks and, in this case, propagated to the API provider (a CICS application).

12. Close and view the *syslogall.log* file again. At the bottom of the file you should see messages like these:

```
EZD1281I TTLS Map CONNID: 00001E0C LOCAL: 192.168.17.201..7419 REMOTE:
192.168.17.201..9443 JOBNAME: USER1GET USERID: USER1 TYPE: OutBound STATUS:
Enabled RULE: zCEEClientRule~1 ACTIONS: gAct1~zCEEClient eAct1~zCEEClient
cAct1~zCEEClient
EZD1283I TTLS Event GRPID: 00000001 ENVID: 00000001 CONNID: 00001E0C RC:
0 Initial Handshake 00000050115258D0 0000005011522750 TLSV1.2 F0F0F3F5
```

These messages are recording the role of AT-TLS in the handshake with the z/OS Connect server.

13. Change the jobname to something else and submit the job again for execution. This time the job should terminate with a return code of 5 and these messages in the SYSOUT

```
Error code: 0000000005
Error msg:BAQI0005E: Unable to send request to or receive response from the
z/OS Connect EE server.HWTHRQST RC=262(0x106) RSC=0 RSN=Connectivity appears
to be lost
```

```
Error origin:STUB
```

The *messages.log* file for the server will have this message.

```
CWWKO0801E: Unable to initialize SSL connection. Unauthorized access was
denied or security settings have expired. Exception is
javax.net.ssl.SSLException: Unrecognized SSL message, plaintext connection?
```

A connection attempt was made to a HTTPS port using HTTP. The AT-TLS policy that acts as a surrogate client was not trigger because AT-TLS will only be triggered when the job name matches the value in the traffic descriptor configuration element.

Summary

An AT-TLS policy has been created and used to encrypt traffic from a batch API requester client application. By introducing intentional errors we have confirmed the TLS handshakes are taking place and/or failing as expected.

Appendix – AT-TLS Policy Agent Configuration File

```
