Important: At URL <https://ibm.box.com/v/WSC-AdminSecurity> there is a file named *Admin Security CopyPaste.txt*. This file contains commands and other text used in this workshop. Locate that file and open it. Download this file and use the copy-and-paste function (**Ctrl-C** and **Ctrl-V**) to enter commands or text. It will save time and help avoid typo errors. As a reminder text that appears in this file will be highlighted in yellow.

Note: Connectivity from the remote Desktop to this site is not always available. In this case, access this URL from your local Desktop and then copy the file from the local Desktop to the remote Desktop.

General Exercise Information and Guidelines

- ✓ This exercise requires the completion of the *IBM z/OS Connect Customization - Basic Configuration (1 of 2)* and *IBM z/OS Connect Customization - Basic Security (2 of 2)* exercises before it can be performed.
- ✓ This exercise requires using z/OS user identities *FRED* and *USER1*. The password for these users will be provided by the lab instructions.
- ✓ There are examples of *server.xml* scattered through this exercise. Your *server.xml* may differ depending on which exercises have been previously performed. Be sure the **red lines** in these examples are either added or already present.
- ✓ The acronyms RACF (resource access control facility) and SAF (system authorization facility) are used in this exercise. RACF is the IBM security manager product whereas SAF is a generic term for any security manager product, e.g., ACF2 or Top Secret or RACF. An attempt has been to use SAF when referring to information appropriate for any SAF product and to use RACF when referring to specific RACF commands or examples.
- ✓ Any time you have any questions about the use of IBM z/OS Explorer, 3270 screens, features or tools do not hesitate to ask the instructor for assistance.
- ✓ Text in **bold** and highlighted in **yellow** in this document should be available for copying and pasting in a file named *Security CopyPaste* file on the desktop.
- ✓ Please note that there may be minor differences between the screen shots in this exercise versus what you see when performing this exercise. These differences should not impact the completion of this exercise.
- ✓ For information regarding the use of the Personal Communication 3270 emulator, see the *Personal Communications Tips* PDF in the exercise folder.

Overview

This exercise demonstrates the steps required to enable security between a z/OS Connect server and a Db2 subsystem.

In part one of the exercise, the use of RACF pass tickets will be configured. RACF pass tickets can be used to pass the z/OS Connect authenticated RACF identity to a Db2 subsystems for Db2 authorization checks.

In part two of the exercise, TLS support will be added by configuring an AT-TLS policy. The presence of this policy will act as a surrogate for handing the server role on behalf of the Db2 subsystem.

Enabling RACF Pass Tickets

When sending a request from an z/OS Connect server to Db2 the identity used for Db2 authorization checks is either the identity configured in the basic authentication element for the Db2 client connection or the identity associated with the client certificate exchanged during a mutual authentication handshake. In both cases, this identity is associated with the server and not the individual identities under which the requests are running.

To provide identity assertion of the individual requests requires the use of RACF Pass Tickets. When RACF Pass Tickets are enabled, the z/OS Connect server will obtain a pass ticket from RACF and send this ticket (token) with the request to Db2. When the request arrives at the Db2 subsystem Db2 will validate this ticket with RACF and extract the z/OS Connect authenticated identity from the token and use for subsequent Db2 authorization checks.

Test with RACF Pass Tickets not enabled

But first, let's explore invoking an Db2 API and observe the behavior when identity propagation is not enabled.

1. Edit the *server.xml* configuration file for the *myServer* server, e.g., */var/zosconnect/servers/myServer/server.xml* and add includes for *shared.xml* and *db2.xml* (if not already present) see below:

```
<include location="${shared.config.dir}/db2.xml"/>
```

```
<include location="${shared.config.dir}/shared.xml"/>
```

```
<include location="${shared.config.dir}/safSecurity.xml"/>
<include location="${shared.config.dir}/ipic.xml"/>
<include location="${shared.config.dir}/keyringMutual.xml"/>
<include location="${shared.config.dir}/groupAccess.xml"/>
<include location="${shared.config.dir}/db2.xml"/>
<include location="${shared.config.dir}/shared.xml"/>
```

This will install some predefined services and APIs in the server.

2. Stop and restart the server with MVS commands **P BAQSTRT** and **S BAQSTRT**.

Tech-Tip: MVS and JES2 commands can be entered from SDSF by enter a / (slash) on the command line followed by the command itself (e.g. /D T). The command results can be found in the system log. If a command is especially long, then simply entering a / (slash) to display a *SDSF – System Command Extension* panel where a command can span multiple lines. When an MVS command must be entered, the instructions in these exercises will indicate that the command is an MVS command. MVS commands can be enter at the prompt by using the / (slash) prefix or using the *SDSF – System Command Extension* panel.

3. Open a DOS command prompt and go to directory *c:/z/admin*.

4. Enter the cURL command below:

```
curl -X get --cacert certauth.pem --cert fred.p12:secret --cert-type P12  
https://wg31.washington.ibm.com:9443/db2/employee/000010
```

:

```
c:\z\admin>curl -X get --cacert certauth.pem --cert fred.p12:secret --cert-type P12  
https://wg31.washington.ibm.com:9443/db2/employee/000010  
{ "StatusDescription": "Execution Successful", "ResultSet  
Output": [{"firstName": "CHRISTINE", "lastName": "HAAS", "middleInitial": "I", "phoneNumber":  
"3978", "department": "A00", "job": "PRES  
, "employeeNumber": "000010"}], "StatusCode": 200}
```

5. Enter the cURL command below:

```
curl -X GET --cacert certauth.pem --cert user1.p12:secret --cert-type P12  
https://wg31.washington.ibm.com:9443/db2/employee/000010
```

You should see the same results because the request to Db2 are using the basic authentication as configured in the db2.xml (see below).

```
<zoscconnect_zosConnectServiceRestClientConnection id="Db2Conn"  
  host="wg31.washington.ibm.com"  
  port="2446"  
  basicAuthRef="dsn2Auth" />  
  
<zoscconnect_zosConnectServiceRestClientBasicAuth id="dsn2Auth"  
  userName="USER1"  
  password="USER1"/>
```

USER1 has READ access to DSNR resource DSN2.REST.

Test with identity propagation enabled using RACF Pass Tickets

Next enable the use of RACF pass tickets in the server.xml file and retest and the observe the results.

- ___1. Begin by submitting the job in member *DB2PTKT* in data set *USER1.ZCEE30.CNTL*.

```
RDEFINE PTKTDATA DSN2APPL SSIGNON(KEYMASK(123456789ABCDEF0)) +
APPLDATA('NO REPLAY PROTECTION')

RDEFINE PTKTDATA IRRPTAUTH.DSN2APPL.* UACC(NONE)
PERMIT IRRPTAUTH.DSN2APPL.* ID(LIBSERV) CLASS(PTKTDATA) ACC(UPDATE)

SETROPTS RACLIST(PTKTDATA) REFRESH
```

These commands define the required *PTKTDATA* resource *DSN2APPL*.

Tech-Tip: The value DSN2APPL was derived from the Db2 LU name in the DSNL004I startup message, for example.

```
DSNL004I -DSN2 DDF START COMPLETE 906
LOCATION DSN2LOC
LU      USIBMWZ.DSN2APPL
GENERICLU -NONE
DOMAIN  WG31.WASHINGTON.IBM.COM
TCPPORT 2446
SECPORT 2445
RESPORT 2447
IPNAME  -NONE
OPTIONS:
PKGREL = COMMIT
```

The value for the key mask was an arbitrary 16 hexadecimal string. If multiple RACF databases are involved this value must be the same for all.

2. Edit the server's server.xml file and change the include for *db2.xml* to an include for *db2passTicket.xml*.

```
<include location="{shared.config.dir}/db2passTicket.xml"/>
```

```
<include location="{shared.config.dir}/safSecurity.xml"/>
<include location="{shared.config.dir}/ipic.xml"/>
<include location="{shared.config.dir}/keyringMutual.xml"/>    <include
location="{shared.config.dir}/groupAccess.xml"/>
<include location="{shared.config.dir}/db2passTicket.xml"/>
<include location="{shared.config.dir}/shared.xml"/>
```

The contents of db2passTicket are shown below.

```
<zosconnect_zosConnectServiceRestClientConnection id="Db2Conn"
  host="wg31.washington.ibm.com"
  port="2446"
  basicAuthRef="dsn2Auth" />

<zosconnect_zosConnectServiceRestClientBasicAuth id="dsn2Auth"
  applName="DSN2APPL"/>
```

3. Refresh the server's configuration using the MVS command **F BAQSTRT,REFRESH,CONFIG**

4. Enter the cURL command below:

```
curl -X get --cacert certauth.pem --cert fred.p12:secret --cert-type P12
https://wg31.washington.ibm.com:9443/db2/employee/000010
```

```
c:\z\admin>curl -X get --cacert certauth.pem --cert fred.p12:secret --cert-type P12
https://wg31.washington.ibm.com:9443/db2/employee/000010
{"errorMessage":"BAQR0429W: API db2employee encountered an error while processing a
request under URL https://wg31.washington.ibm.com:9443/db2/employee/000010."}
```

5. Review the JES log for the DDF task *DSN2DIST* and you should see this message.

```
ICH408I USER(FRED      ) GROUP(ATSGRP  ) NAME(USER FRED
DSN2.REST CL(DSNR      )
INSUFFICIENT ACCESS AUTHORITY
ACCESS INTENT(READ     ) ACCESS ALLOWED(NONE    )
```

Identity FRED does not have access to the DSNR REST resource protecting this Db2 subsystem.

___ 6. Enter the cURL command below:

```
curl -X get --cacert certauth.pem --cert user1.p12:secret --cert-type P12  
https://wg31.washington.ibm.com:9443/db2/employee/000010
```

```
c:\z\admin>curl -X get --cacert certauth.pem --cert user1.p12:secret --cert-type P12  
https://wg31.washington.ibm.com:9443/db2/employee/000010  
{ "StatusDescription": "Execution Successful", "ResultSet  
Output": [{"firstName": "CHRISTINE", "lastName": "HAAS", "middleInitial": "I", "phoneNumber":
```

Identity USER1 does access to the DSNR REST resource protecting this Db2 subsystem.

Summary

In this section a simple REST client has been used to invoke an API which accesses a Db2 subsystem. The API was initially tested without RACF Pass Tickets and using the basic authentication configured in the server. Required RACF resources were then defined, and changes were made to the server.xml so RACF Pass Tickets would be used between the server and Db2. Finally, the cURL command was used to demonstrate that the identity associated with the client certificate (fred.p12 and user1.p12) provided by the cURL command were propagated to Db2 for authorization checks.

Configuring TLS security to a Db2 Subsystem

Adding TLS support to a Db2 subsystem requires the creation of a key ring belonging to the identity under which the Db2 subsystem is executing (look for message IEF695I in the DSN2DSNT task's JES messages). This key ring contains the personal and all the certificate authority certificates that will be used during TLS handshakes. The creation of the key ring and the connection of certificates to the key ring are done using the RACDCERT RACF commands.

Creating Db2 SAF resources

- ___ 1. Browse data set *USER1.ZCEE30.CNTL*. You should see the members in that data set.
- ___ 2. Browse member **ZCEETSLC** (SSL client role), you should see the RACF commands below. Submit the job for execution only if this job has not been previously submitted in another exercise.

```
/* Create personal certificate for zCEE outbound client request */
racdcert id(libserv) gencert subjectsdn(cn('zCEE Client Cert') +
ou('ATS') o('IBM')) withlabel('zCEE Client Cert') signwith(certauth +
label('zCEE CA')) notafter(date(2022/12/31))

/* Create zCEE outbound key ring and connect certificates */
racdcert id(libserv) addring(zCEE.KeyRing)

racdcert id(libserv) connect(ring(zCEE.KeyRing) +
label('zCEE CA') certauth usage(certauth))

racdcert id(libserv) connect(ring(zCEE.KeyRing) +
label('Liberty CA') certauth usage(certauth))

/* Connect CA certificate to Liberty inbound key ring */
racdcert id(libserv) connect(ring(Liberty.KeyRing) +
label('zCEE CA') certauth usage(certauth))

/* Connect default personal certificate */
racdcert id(libserv) connect(ring(zCEE.KeyRing) +
label('zCEE Client Cert') default)

racdcert id(libserv) listring(zCEE.KeyRing)
racdcert id(libserv) list

setr raclist(digtcert digtring) refresh

connect    libserv  group(zceeusrs)
connect    libserv  group(gminvoke)
```

These commands

- Define a personal certificate for the z/OS Connect server for use during outbound handshakes.
- Define a key ring to be used for outbound handshakes.
- Connect the z/OS Connect server personal certificate to this key ring.
- Connect the certificate authority (CA) public certificate used to sign the z/OS Connect server's outbound personal certificate to this key ring.
- Connect the CA public certificate used to sign the API provider server's certificate to this key ring.
- Connects the CA public certificate used to sign the z/OS Connect server's outbound personal certificate to the API provider's key ring.
- User LIBSERV is given the required authority to access their key ring and certificate.
- The in-storage profile for digital certificates resources are refreshed.
- User LIBSERV is connected to the groups that provide access to this z/OS Connect instance.

Below is a visual representation of the key ring just created:

3. Edit the *server.xml* configuration file for the *myServer* server, e.g. */var/zosconnect/servers/myServer/server.xml* and change the include for file *keyringMutual.xml* to an include of file *keyringOutboundMutua.xml*, see below:

```
<include location="/${shared.config.dir}/keyringOutboundMutual.xml"/>
```

4. Next browse member **DB2TLS**. The job contains the RACF commands below. Submit the job for execution.

```
/* Create a CA certificate for DB2 */
racdcert certauth gencert subjectsdn(cn('Db2 CA') ou('ATS') +
ou('ATS') o('IBM')) withlabel('DB2 CA') keyusage(certsign) +
notafter(date(2022/12/31))

/* Create a server certificate for DB2 client request */
racdcert id(DB2USER) gencert subjectsdn(cn('wg31.washington.ibm.com') +
ou('ATS') o('IBM')) withlabel('DB2USER') signwith(certauth +
label('DB2 CA')) notafter(date(2021/12/31))

setr raclist(digtcert,digtmap) refresh

/* Create DB2 key ring and connect CA and personal certificates */
racdcert id(db2user) addring(Db2.KeyRing)

racdcert id(db2user) connect(ring(Db2.KeyRing) +
label('DB2 CA') certauth usage(certauth))

racdcert id(db2user) connect(ring(Db2.KeyRing) +
label('zCEE CA') certauth usage(certauth))

racdcert id(libserv) connect(ring(zCEE.KeyRing) +
label('DB2 CA') certauth usage(certauth))

/* Connect default personal certificate */
racdcert id(db2user) connect(ring(Db2.KeyRing) +
label('DB2USER') default

setropts raclist(digtring,digtmap) refresh
```

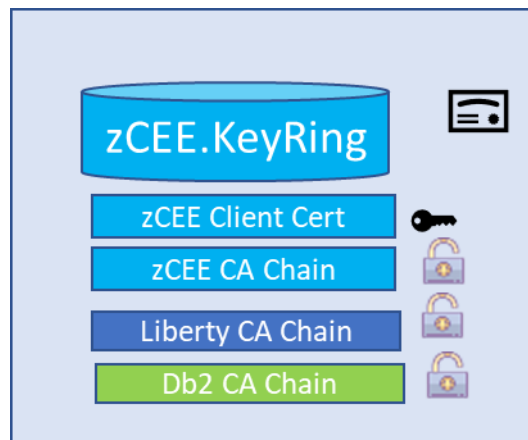

These commands

- Define a certificate authority certificate used to sign Db2 certificates used during TLS handshakes.
- Define a personal certificate for the Db2 server for use during TLS handshakes.
- Define a key ring to be used for TLS handshakes.
- Connect the Db2 server personal certificate to this key ring.
- Connect the CA public certificate used to sign the Db2 server's certificate to this key ring.
- Connect the CA public certificate used to sign the z/OS Connect server's outbound personal certificate to this key ring.
- The in-storage profile for digital certificates resources are refreshed.

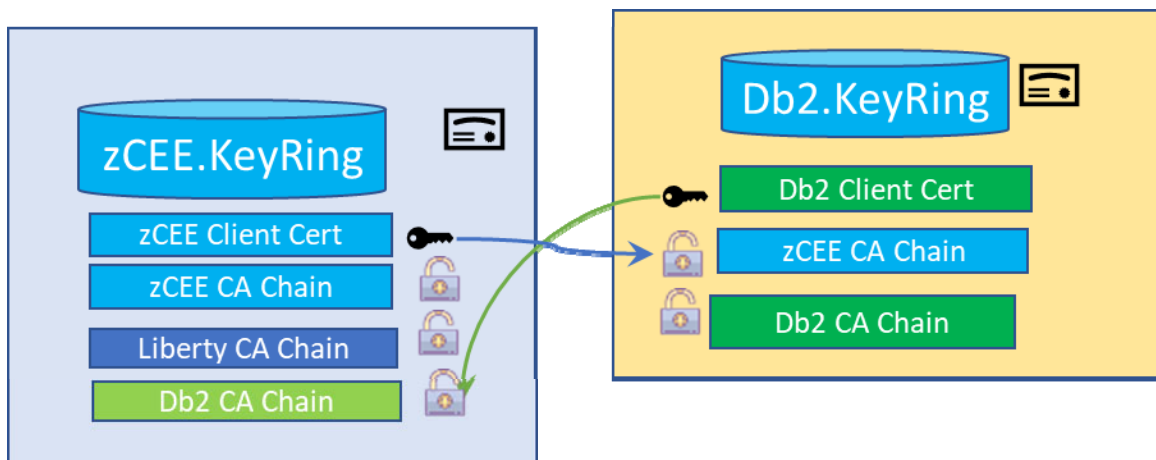

Below is a visual representation of the key ring just created:

And the update made to the z/OS Connect server's outbound keyring:

And the handshakes will flow as shown below:

5. Edit the *server.xml* configuration file for the *myServer* server, e.g. */var/zosconnect/servers/myServer/server.xml* and change the include for file *keyringMutual.xml* to an include of file *keyringOutBoundMutual.xml*, see below:

```
<include location="${shared.config.dir}/keyringOutboundMutual.xml"/>
```

```
<include location="${shared.config.dir}/safSecurity.xml"/>
<include location="${shared.config.dir}/ipicIDProp.xml"/>
<include location="${shared.config.dir}/keyringOutboundMutual.xml"/>
<include location="${shared.config.dir}/groupAccess.xml"/>
<include location="${shared.config.dir}/apiRequesterHTTPS.xml"/>
<include location="${shared.config.dir}/imsDatabase.xml"/>
<include location="${shared.config.dir}/db2passTicket.xml"/>
<include location="${shared.config.dir}/shared.xml"/>
```

The contents of *keyringOutboundMutual.xml* are shown below.

```
<!-- Enable features -->
<featureManager>
  <feature>transportSecurity-1.0</feature>
</featureManager>

<sslDefault sslRef="DefaultSSLSettings"
  outboundSSLRef="OutboundSSLSettings" />

<ssl id="DefaultSSLSettings"
  keyStoreRef="CellDefaultKeyStore"
  trustStoreRef="CellDefaultKeyStore"
  clientAuthenticationSupported="true"
  clientAuthentication="true"/>

<keyStore id="CellDefaultKeyStore"
  location="safkeyring:///Keyring.LIBERTY"
  password="password" type="JCERACFKS"
  fileBased="false" readOnly="true" />

<ssl id="OutboundSSLSettings"
  keyStoreRef="OutboundKeyStore"
  trustStoreRef="OutboundKeyStore"/>

<keyStore id="OutboundKeyStore"
  location="safkeyring:///zCEE.KeyRing"
  password="password" type="JCERACFKS"
  fileBased="false" readOnly="true" />
```

- ___ 6. Enter MVS commands *P BAQSRT and S BASSTRT* to refresh the z/OS Connect server's runtime configuration.

Tech-Tip: Updates to keyrings could have been refreshed in the server by using this command :

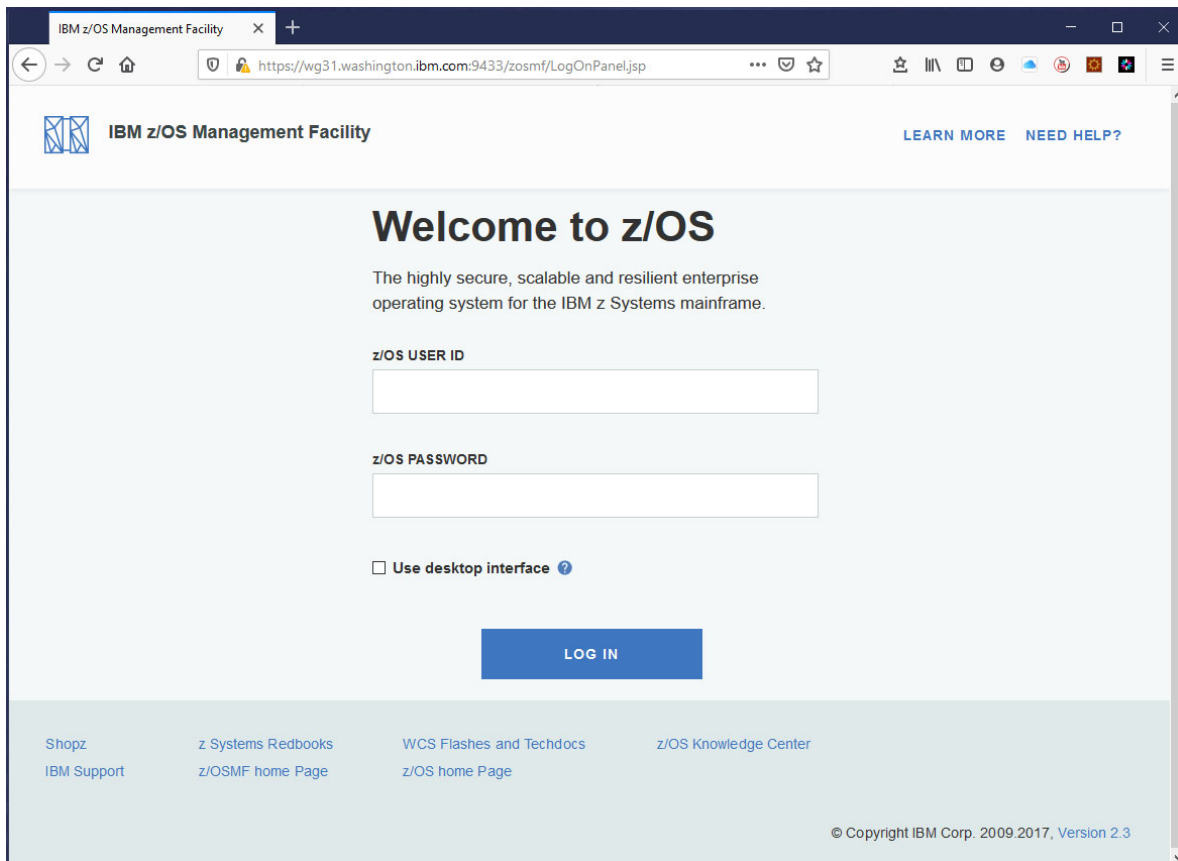

F BAQSTRT,REFRESH,KEYSTORE

This would have dynamically made the information about CICS CA certificate available in the z/OS Connect runtime.

Configure the AT-TLS policy

z/OSMF will be used in this section to configure the AT-TLS configuration for the desired outbound policy.

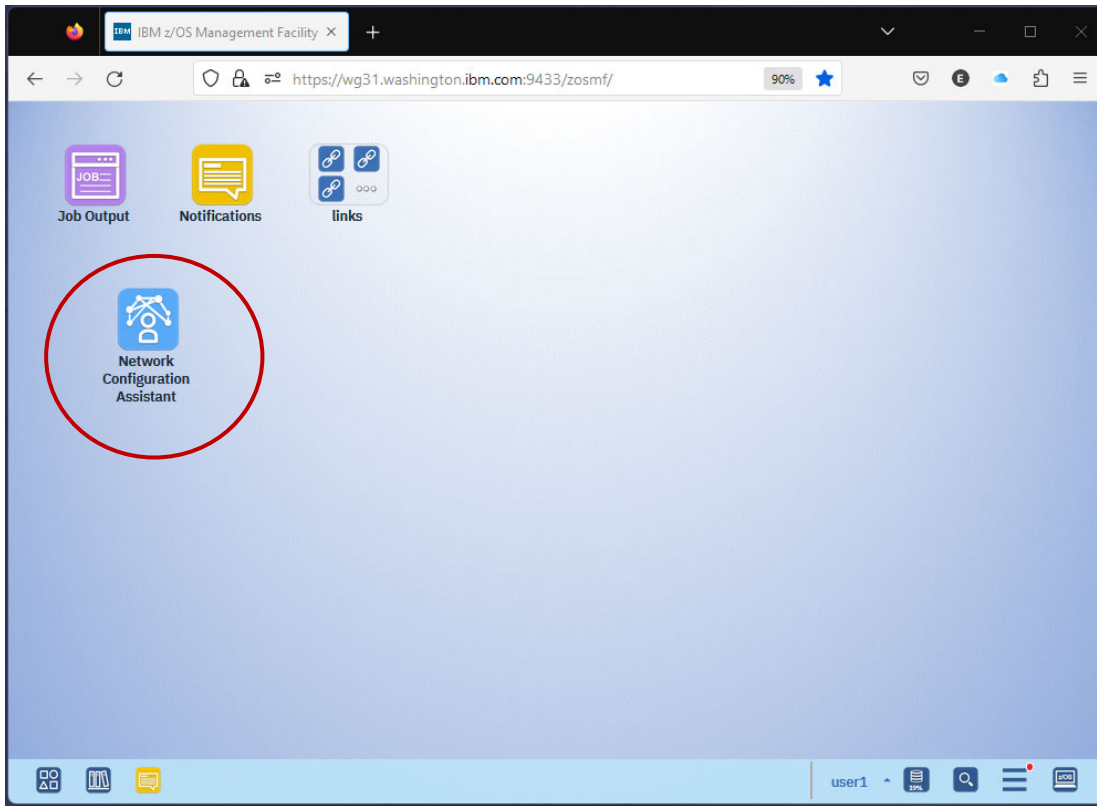

1. In a Firefox browser enter URL <https://wg31.washington.ibm.com:9433/zosmf> and you should see the *IBM z/OS Management Facility* window.

Note that some of the AT-TLS configurations steps described here may have been performed in another exercise.

2. Enter *USER1* as the *z/OS USER ID* and *USER1*'s password and click the **LOG IN** button.

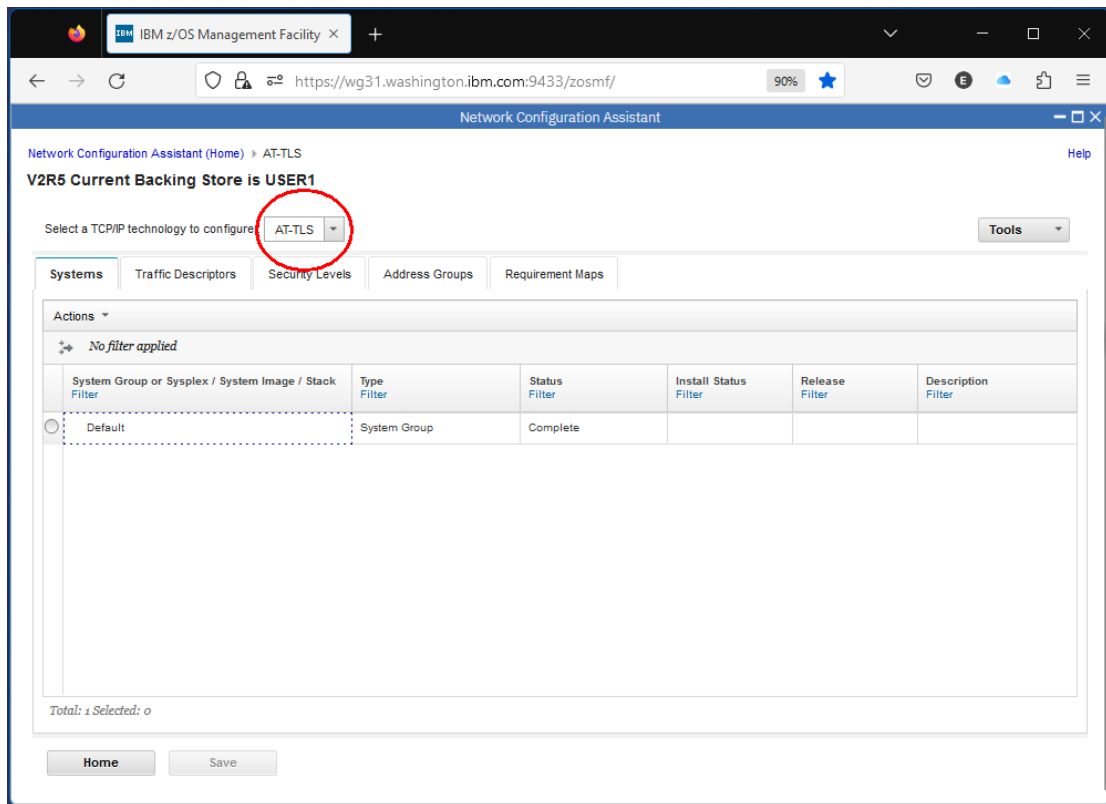

- ___ 3. On the initial zOSMF panel, select the *Network Configuration Assistant* by double clicking on the icon labeled *Network Configuration Assistant*.

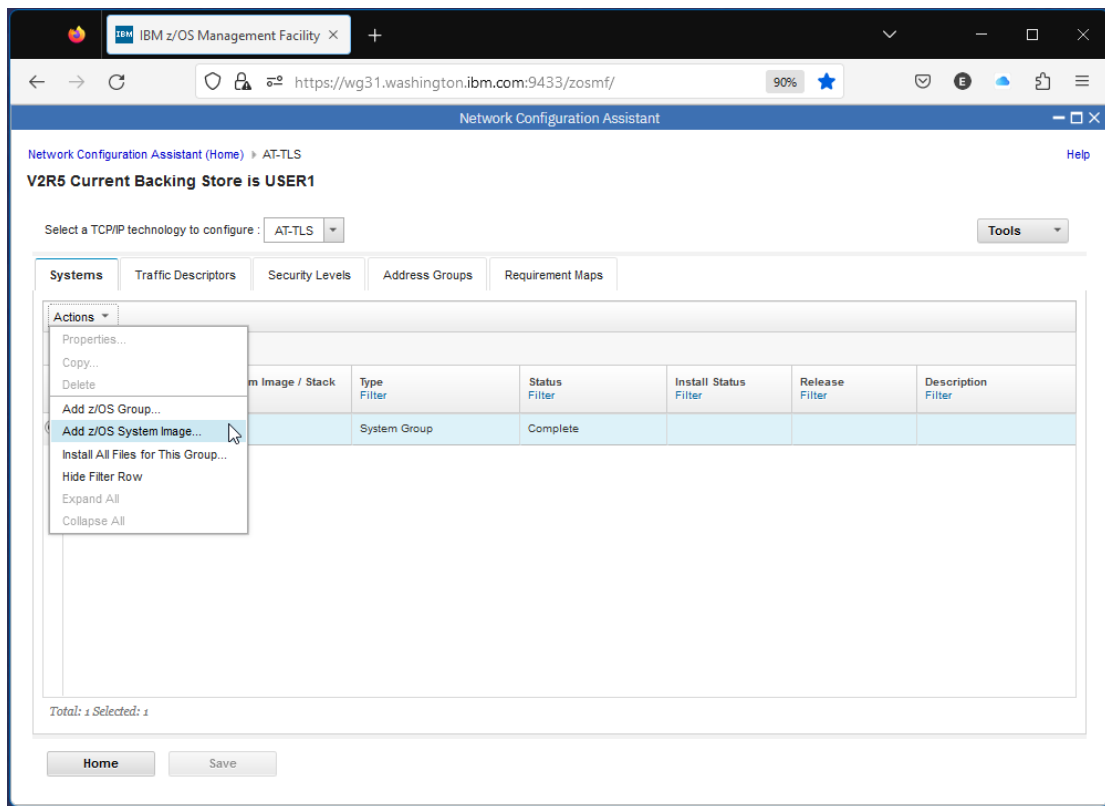

Tech-Tip: Subsequent screen shot show the *Network Configuration Assistance* expanded to fill the browser screen.

- ___ 4. Select the radio button beside *Create or transfer a new backing store* option and click the **Proceed** button.
- ___ 5. On the next screen select the radio button beside *Create a New Backing Store File* and enter **USER1** in the area beside *File Name*. Press the **OK** button and press the **OK** button on the Information pop-up.

6. On the *Network Configuration* tab use the pull-down arrow to select *AT-TLS* as the *TCP/IP technology* to configure.

7. Select the radio button beside the *Default - System Group* and use the *Action* pull-down button to select *Add z/OS System Image* option.

8. On the *Add z/OS System Image* window enter **WG31** for the image *Name* and check the radio button beside *Simple name (as in an SAF product...)*. Enter **Liberty.KeyRing** as the default AT-TLS key ring name. Click **OK** to continue.

The screenshot shows the 'Network Configuration Assistant' window with the 'Add z/OS System Image' tab selected. The 'Name' field is populated with 'WG31'. The 'z/OS Release' dropdown is set to 'V2R5'. In the 'Default AT-TLS key ring database' section, the first radio button option is selected, and the 'Key ring' field contains the text 'Liberty.KeyRing'. The 'OK' button is located at the bottom left of the window.

Tech Tip: The value for the key ring will be used if an explicit key ring is not provided for a policy.

We recommend establishing a naming convention for key rings with each SAF identity by using the same key ring name. Using this name as an example, you could create a unique key ring named *Liberty.KeyRing* for SAF identities USER1, USER2, FRED, etc. Each user's key ring would have the same name but a different set of connected certificates. One default key ring specified at the image level covers all users.

9. On the *Proceed to the Next Step?* pop-up click the **Proceed** button.

10. The *Add TCP/IP Stack* screen should be displayed. Select this option to expose the *Network Configuration* tab. Enter **TCPIP** as the name of the stack. Click **OK** to continue.

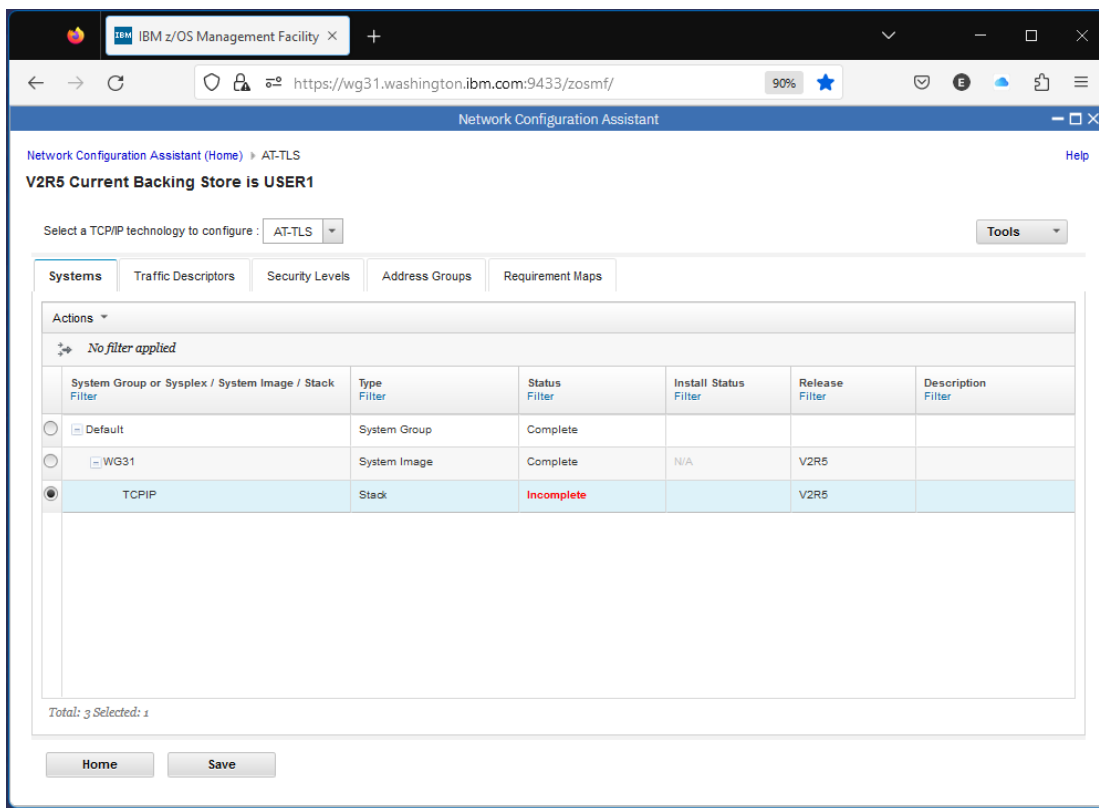

Tech-Tip: The value for the stack name was determined by the TCPIP Name display by entering the MVS command D TCPIP.

```
EZAOP50I TCPIP STATUS REPORT 007
COUNT   TCPIP NAME   VERSION   STATUS
-----
      1   TCPIP1      CS V2R3   ACTIVE
*** END TCPIP STATUS REPORT ***
EZAOP41I 'DISPLAY TCPIP' COMMAND COMPLETED SUCCESSFULLY
```

11. Before any TCP/IP stack rules can be added, *Traffic Descriptors*, *Address Groups* and *Requirement Maps* need to be defined. Click **Cancel** on the *Proceed to the Next Step?* displayed at this time.

12. This will display the window below:

Tech Tip: The **Incomplete** warning will be addressed shortly.

13. Select the radio button beside *WG31* and use the *Actions* pull-down to select *Properties*. On the *Modify z/OS System Image* window, select the *System Image Level Settings* tab. Check all the trace level boxes as shown below. This is being done so we can confirm AT-TLS is being invoked and identify issues. Press **OK** to continue.

IBM z/OS Management Facility

Network Configuration Assistant

Network Configuration Assistant (Home) > AT-TLS > z/OS System Image

Modify z/OS System Image

General System Image Level Settings Advanced LDAP HTTP OCSP CRL Advanced

Default AT-TLS key ring database

☒ Simple name (as in an SAF product or in PKCS #11 token format)

* Key ring:

LibertyKeyRing

☐ Key database is a z/OS UNIX file system file:

* Key database:

☐ * Key database stash file:

or

☐ * Key database password:

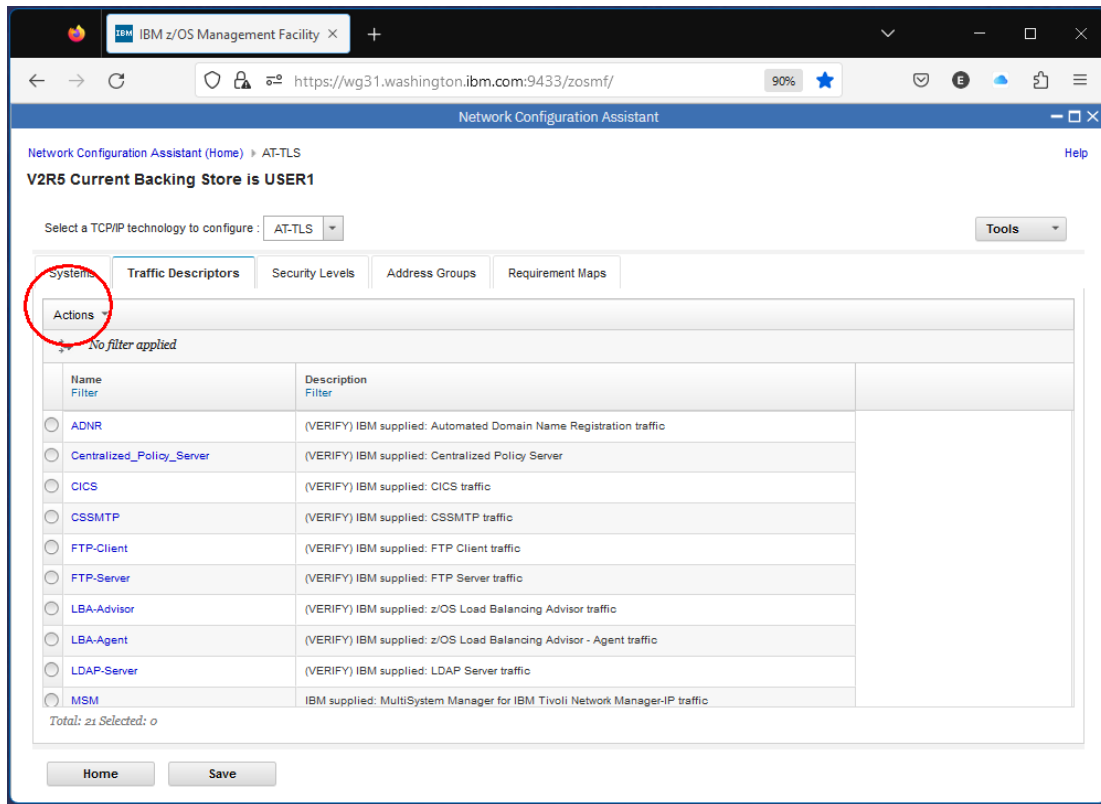

Reaccess Key Rings...

Default AT-TLS trace level

☒ Level 1 - Errors (to TCP/IP joblog) ☒ Level 2 - Errors (to syslog) ☒ Level 4 - Information (to syslog)

OK Cancel

14. Select the *Traffic Descriptors* tab and use the *Actions* pull-down to select *New*.

15. On the *New Traffic Descriptor* window, enter **Db2Server** as the *Name*. Use the *Actions* pull-down and select *New* to start the definition of a new traffic descriptor type.

Network Configuration Assistant (Home) > AT-TLS > Traffic Descriptor

New Traffic Descriptor

Traffic descriptors contain details of traffic types which are mapped to security levels within requirement maps. A traffic descriptor can contain a single type of traffic or multiple types of traffic.

* Name:

Description:

List of traffic types in this traffic descriptor

Protocol	Local Port	Remote Port	Connect Direction	Job Name	User ID
There is no data to display.					

Total: 0 Selected: 0

OK Cancel

16. On the *New Traffic Type – TCP* window, select the radio button beside *Single ports* under *Local port* and enter **2445** as the port number. Select the radio button *All ports* under *Remote port*. Select the radio button beside *Inbound only* under *Indicate the TCP connection direction*. Enter **DSN2DIST** in the area under *Jobname* and finally select the radio button beside *Server* under *AT-TLS Handshake Role*. Next click on the *KeyRing* tab to continue.

Tech-Tip: This traffic definition is triggered when a client attempts to connect to port 2445. Port 2445 was identified as the Db2 SECPORT in startup message.

```

DSNL004I -DSN2 DDF START COMPLETE
LOCATION DSN2LOC
LU      USIBMWZ.DSN2APPL
GENERICLU -NONE
DOMAIN  WG31.WASHINGTON.IBM.COM
TCPPOINT 2446
SECPOINT 2445
RESPORT 2447
IPNAME   -NONE
OPTIONS:
PKGREL = COMMIT

```

If all the defined conditions are met, AT-TLS will act as a surrogate for the server during a TLS handshake. Note the *KeyRing* tab can be used to specify the name of the key ring to be used for this handshake, e.g., Db2.KeyRing. Otherwise, the default is to use the same key ring name defined for the z/OS System image, e.g. Liberty.KeyRing.

17. On the *KeyRing* tab, select the radio button beside *Use a Simple name* and enter **Db2.KeyRing** as the key ring name. Click **OK** twice to continue.

The screenshot shows the IBM z/OS Management Facility Network Configuration Assistant (NCA) interface. The browser address bar shows the URL `https://wg31.washington.ibm.com:9433/zosmf/`. The NCA window title is "Network Configuration Assistant". The breadcrumb navigation shows: "Network Configuration Assistant (Home) > AT-TLS > Traffic Descriptor > Traffic Type - TCP". The "New Traffic Type - TCP" window has three tabs: "Details", "KeyRing", and "Advanced". The "KeyRing" tab is active. The instructions state: "Specify the key ring database to use for the traffic type specified on the Details tab." There are two radio button options: "Use the key ring database defined for the z/OS system image." (unselected) and "Use a Simple name (as in a SAF product or in PKCS #11 Token format):" (selected). Under the selected option, there is a text field labeled "* Key ring:" containing the text "Db2.KeyRing". Below this, there is an option "Use this z/OS UNIX file system key database:" (unselected). Under this option, there are three radio button options: "* Key database stash file:" (selected), "* Key database password:" (unselected), and "* Key database password:" (unselected). Below these options, there is a "Certificate Label:" text field. At the bottom, there is a checkbox labeled "Specified server certificate labels to be used by server to accommodate clients with different types of public keys." which is unchecked. Below the checkbox, there is a table with the following structure:

Actions	
	Certificate Label
<input type="radio"/>	
<input type="radio"/>	
<input type="radio"/>	

18. Next, click the Security Levels tab and use the *Actions* pull-down button and select the *New* option. On the *New Security Level* windows, enter **zCEESecurity** for the *Name* and check the box beside *TLS V1.3* and *TLS V1.2* and uncheck the other boxes. Click **Next** to display the *Cipher selection* options. Click **Next** to display the *Advanced Settings* options exploring as you like but there is no need to make any changes. Click **Finish** to continue.

The screenshot shows the 'New Security Level' window in the IBM z/OS Management Facility. The 'Name' field is populated with 'zCEESecurity'. Under the 'Version choices' section, the following options are visible:

- ☒ TLS V1.3 (Available beginning with z/OS V2R4)
- ☒ TLS V1.2
- ☐ TLS V1.1
- ☐ TLS V1.0 (not recommended)
- ☐ SSL V3 (not recommended)

The 'Next >' button is highlighted, indicating the next step in the configuration process.

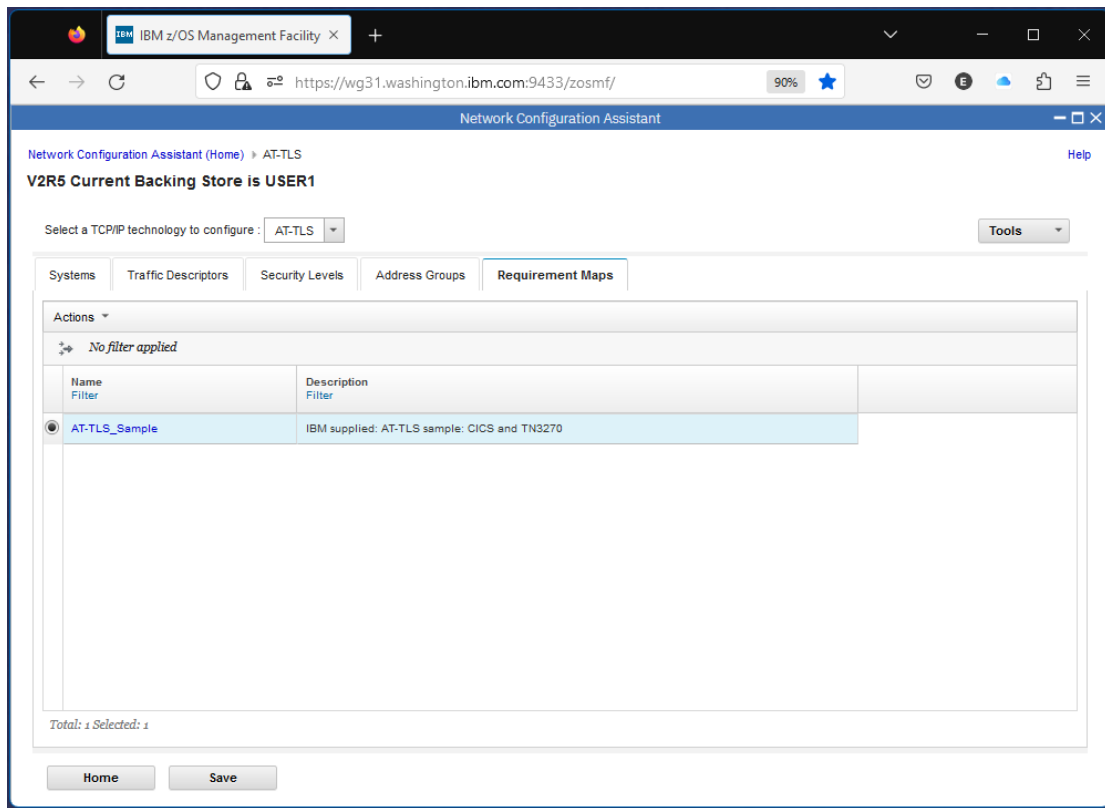

Tech Tip: The key ring specified here belongs to identity DB2USER. This is the identity under which the z/OS Connect server is running. This ring has these certificates connected.

```
>Db2.KeyRing<
Certificate Label Name      Cert Owner      USAGE      DEFAULT
-----
DB2 CA                     CERTAUTH       CERTAUTH   NO
zCEE CA                    CERTAUTH       CERTAUTH   NO
DB2USER                    ID (DB2USER)   PERSONAL   YES
```

The z/OS Connect out bound JSSE key ring has these certificates connected.

```
Ring:
>zCEE.KeyRing<
Certificate Label Name      Cert Owner      USAGE      DEFAULT
-----
zCEE CA                     CERTAUTH       CERTAUTH   NO
Liberty CA                  CERTAUTH       CERTAUTH   NO
zCEE Client Cert            ID (LIBSERV)   PERSONAL   YES
zCEE-CertAuth               CERTAUTH       CERTAUTH   NO
DB2 CA                      CERTAUTH       CERTAUTH   NO
```

___19. Next, click the *Requirement Maps* tab. Use the *Actions* pull-down button to select the *New* option.

20. On the *New Requirement Map* window, enter **Db2RequirementMap** as the *Name*. Use the pull-down arrows to select *Db2Server* as the *Traffic Descriptor* and *zCEESecurity* as the *Security Level* for this map. Click **OK** to continue.

Network Configuration Assistant (Home) > AT-TLS > Requirement Map

New Requirement Map

A requirement map is an object that maps each IP traffic type (traffic descriptor) to a specific level of security (security level).

To add a new mapping to the requirement map:

1. Click the "Add Row" action or use an existing row
2. Click a table cell to select a traffic descriptor from the list
3. Click a table cell to select a security level from the list

* Name:

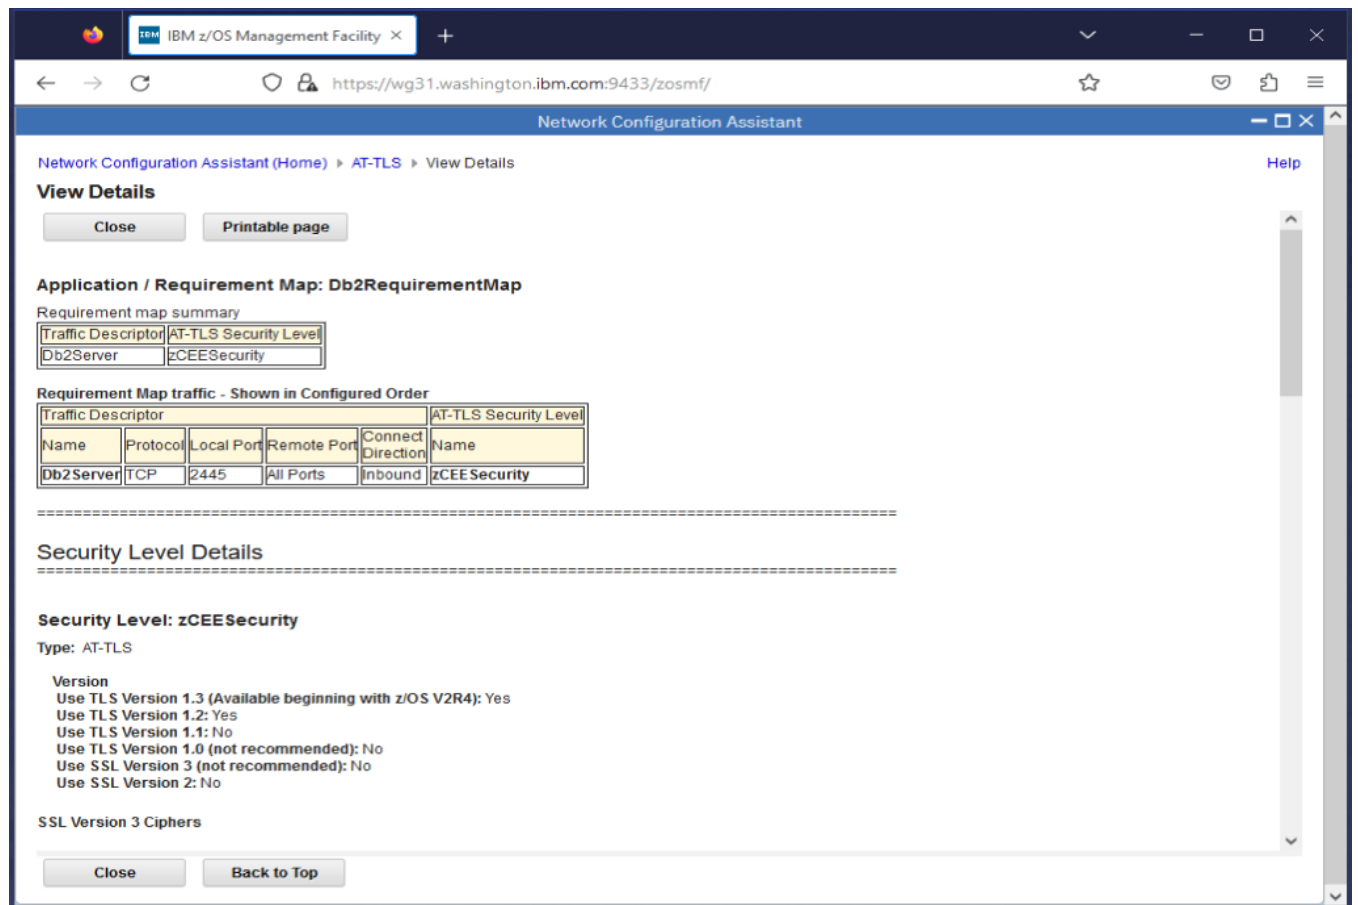

Description:

Mappings table

Actions		Traffic Descriptor	Security Level
<input type="radio"/>	<input type="button" value="Move Up"/> <input type="button" value="Move Down"/>	<input type="text" value="Db2Server"/>	<input type="text" value="zCEESecurity"/>
<input type="radio"/>		<input type="text" value="Select a traffic descriptor"/>	<input type="text" value="Select a security level"/>

Total: 3 Selected: 0

21. Select the radio button beside *Db2RequirementMap* and use the *Actions* pull-down to select the *View Details* options to display the window below. Review the details and click the **Close** button to continue.

22. Click the **Save** button to save the configuration.

___23. When the save has completed, click on the *Systems* tab to return to this window.

Network Configuration Assistant (Home) > AT-TLS

Home Save

24. Select the radio button beside *TCP/IP* and use the *Actions* pull-down to select *Rules*. This is where these definitions will be tied together. Use the *Actions* pull-down again and select *New* to create a new connectivity rule. Enter ***Db2ServerRule*** for the *Connectivity rule name* and press **Next** to continue.

The screenshot shows the 'Network Configuration Assistant' window. The breadcrumb trail is 'Network Configuration Assistant (Home) > AT-TLS > TCP/IP Stack > Connectivity Rule'. The page title is 'New Connectivity Rule'. On the left, there is a sidebar with 'Data Endpoints' selected, and sub-links for 'Requirement Map' and 'Advanced Settings'. The main content area is titled 'Data Endpoints'. It contains a form with the following elements:

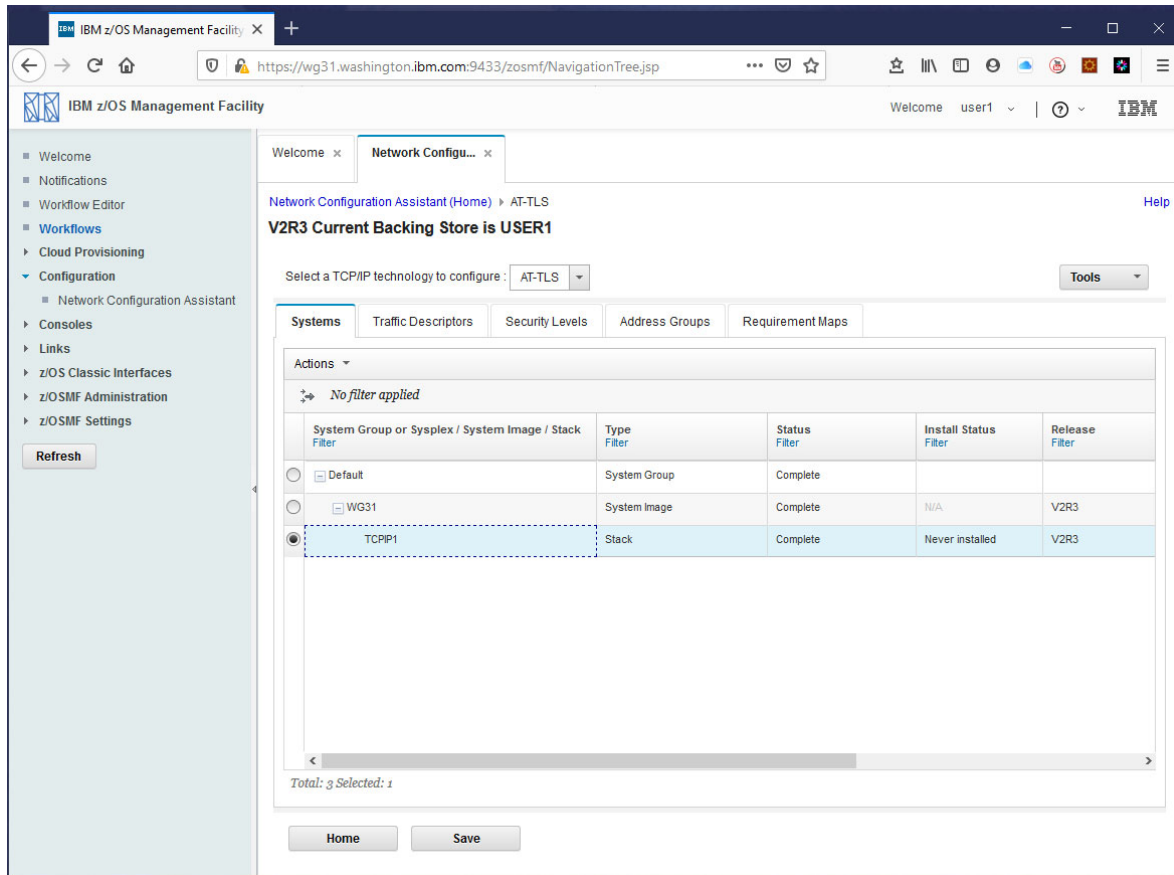

- A label '* Connectivity rule name:' followed by a text input field containing 'Db2ServerRule'.
- A heading 'Select the address groups of the host endpoints of the traffic you want to protect.'
- Two columns for 'Local data endpoint' and 'Remote data endpoint'. Each column has:
 - A radio button selected next to 'Address group:'.
 - A dropdown menu showing 'All_IPv4_Addresses'.
 - An unselected radio button next to '* IPv4 or IPv6 address, subnet, or range:'.
 - A text input field for the address/range.
 - Examples: 'xxxx, xxxxyy, xxxx-yy.yy' and 'xx, xxxyy, xx-y:y'.

At the bottom, there are four buttons: '< Back', 'Next >', 'Finish', and 'Cancel'.

25. On the *New Connectivity Rule – Requirement Map* window, select the radio button beside *Select an existing requirement map* and use the pull-down to select *Db2RequirementMap*. This should automatically populate the mapping table with *Db2Server* as the traffic descriptor and *zCEESecurity* as the security level. Press **Next** and then **Finish** to continue.

The screenshot shows the IBM z/OS Management Facility Network Configuration Assistant. The left sidebar contains a navigation menu with options like Welcome, Notifications, Workflow Editor, Workflows, Cloud Provisioning, Configuration (selected), Consoles, Links, z/OS Classic Interfaces, z/OSMF Administration, and z/OSMF Settings. The main area is titled 'New Connectivity Rule' and has tabs for 'Data Endpoints', 'Requirement Map' (selected), and 'Advanced Settings'. Under 'Requirement Map', there are two radio buttons: 'Create a new requirement map' and 'Select an existing requirement map' (selected). Below the radio buttons is a dropdown menu showing 'Db2RequirementMap'. Under 'Db2RequirementMap properties', there is a text field for 'Name' containing 'Db2RequirementMap' and a text area for 'Description'. Below that is a 'Mappings table' with two columns: 'Traffic Descriptor' and 'Security Level'. The table contains one row with 'Db2Server' and 'zCEESecurity'. At the bottom are buttons for '< Back', 'Next >', 'Finish', and 'Cancel'.

26. Press **Close** to return to this window. Note that the status of the configuration is now complete (*Never installed*).

27. Select the radio button beside *TCPIP* and use the *Actions* pull-down to select *Install All Files for This Group*.

28. On the *List of Configuration Files for All Systems Images in Group Default* window, select *WG31* and use the *Actions* pull-down to select *Install*.

The screenshot shows the IBM z/OS Management Facility (ZOSMF) interface. The browser address bar displays `https://wg31.washington.ibm.com:9433/zosmf/`. The page title is "Network Configuration Assistant". The breadcrumb navigation shows "Network Configuration Assistant (Home) > AT-TLS > Configuration Files". The main heading is "List of Configuration Files for All System Images In Group Default". Below this, there is a table with the following data:

System Image	Configuration Type	Status	Last Install	Configured File Name	Configured Host Name	Configured Installation Method
WG31	TCP/IP - AT-TLS Policy	Never installed	Never	/etc/cfgasst /v2r5/WG31/TCP/IP /tlsPol		Save to disk

At the bottom of the table, it says "Total: 1 Selected: 1". There is a "Close" button at the bottom left of the window.

29. On the *Install File for Default.WG31.TCPIP1* window, click the **GO** button to continue.

30. Click **Close** to continue.

31. Next, click on *AT-TLS* as shown below to return to the primary window.

32. The AT-TLS configuration has been completed and is installed, but it is not active yet.

Activating the AT-TLS configuration

The AT-TLS configuration has been saved in an OMVS file but has not been installed in the active policy agent task (e.g., PAGENT).

1. This instance of the policy agent has been configured to use the *SYSLOGD* daemon task to log messages.

```
//PAGENT EXEC PGM=PAGENT,REGION=0K,TIME=NOLIMIT,
//  PARM='ENVAR("_CEE_ENVFILE_S=DD:STDENV")/-I SYSLOGD'
```

2. The *SYSLOGD* daemon has been configured to write all log messages to file */var/syslogd/syslogall.log* (see the *syslog.conf* file in the */etc* subdirectory) as shown below:

```
#####
#
# Write all messages with priority err and higher to log file errors.
#
#*.err                /var/log/%Y/%m/%d/errors
*.*                  /var/syslogd/syslogall.log
#
```

3. Use ISPF option 3.4 to access directory */var/syslogd* and the *v* line command to view *syslogall.log*. Go the bottom of the file and you will see something like what is shown below:

```
VIEW /SYSTEM/var/syslogd/syslogall.log Columns 00063 00134

003529 ocessing TTLS rule 'Db2Server~1'
```

- ___ 7. Go the bottom of this file and you see these messages

```
EZD1579I PAGENT POLICIES ARE NOT ENABLED FOR TCPIP1 : TTLS
EZZ8771I PAGENT CONFIG POLICY PROCESSING COMPLETE FOR TCPIP1 : QOS
EZZ8771I PAGENT CONFIG POLICY PROCESSING COMPLETE FOR TCPIP1 : TTLS
EZD1586I PAGENT HAS INSTALLED ALL LOCAL POLICIES FOR TCPIP1
Finished main config file update
```

Tech-Tip: If a policy or otherwise changed the new or updated policy can be installed with an MVS modify command, *F PAGENT,REFRESH*

8. The policy agent is active. The policies have been loaded, but there is one remaining step. The TCPIP stack has not been modified to enable TTLS. On this image this has been configured this way so the AT-TLS is disabled by default and must be explicitly enabled. This is done by an MVS VARY command.

V TCPIP,,OBEY,SYS1.TCPPARMS(TTLS)

Where the contents of SYS1.TCPPARMS(TTLS) is simply TCPCONFIG TTLS

Issue this command and you should see these messages in the console, see below:

```
V TCPIP, ,OBEY, SYS1. TCPPARMS (TTLS)
EZZ0060I PROCESSING COMMAND: VARY TCPIP, ,OBEY, SYS1.TCPPARMS (TTLS)
EZZ0300I OPENED OBEYFILE FILE 'SYS1.TCPPARMS (TTLS) '
EZZ0309I PROFILE PROCESSING BEGINNING FOR 'SYS1.TCPPARMS (TTLS) '
EZZ0316I PROFILE PROCESSING COMPLETE FOR FILE 'SYS1.TCPPARMS (TTLS) '
EZZ0053I COMMAND VARY OBEY COMPLETED SUCCESSFULLY
```

Tech-Tip: AT-TLS can also be disabled with a VARY command, *V TCPIP,,OBEY,SYS1.TCPPARMS(NOTTLS)* where the contents of SYS1.TCPPARMS(NOTTLS) is TCPCONFIG NOTTLS

9. Edit the *server.xml* configuration file for the *myServer* server, e.g., */var/zosconnect/servers/myServer/server.xml* and change the include for file *db2passTicket.xml* to an include of file *db2TLS.xml*, see below.

<include location="\$shared.config.dir/db2TLS.xml"/>

```
<include location="$shared.config.dir/safSecurity.xml"/>
<include location="$shared.config.dir/ipicIDProp.xml"/>
<include location="$shared.config.dir/keyringOutboundMutual.xml"/>
<include location="$shared.config.dir/groupAccess.xml"/>
<include location="$shared.config.dir/apiRequesterHTTPS.xml"/>
<include location="$shared.config.dir/imsDatabase.xml"/>
<include location="$shared.config.dir/db2TLS.xml"/>
<include location="$shared.config.dir/shared.xml"/>
```

The contents of *db2TLS.xml* are shown below.

```
<zoscconnect_zosConnectServiceRestClientConnection id="Db2Conn"
  sslCertsRef="OutboundSSLSettings"
  host="wg31.washington.ibm.com"
  port="2445"
  basicAuthRef="dsn2Auth" />

<zoscconnect_zosConnectServiceRestClientBasicAuth id="dsn2Auth"
  applName="DSN2APPL"/>
```

___10. Refresh the z/OS Connect server's profile with MVS command ***F BAQSTRT,REFRESH,CONFIG***

Test the TLS connection from the z/OS Connect Server to a Db2 subsystem

___ 1. Open a DOS command prompt and go to directory *c:/z/admin*.

___ 2. Enter the cURL commands below:

```
curl -X get --cacert certauth.pem --cert fred.p12:secret --cert-type P12  
https://wg31.washington.ibm.com:9443/db2/employee/000010
```

```
curl -X get --cacert certauth.pem --cert user1.p12:secret --cert-type P12  
https://wg31.washington.ibm.com:9443/db2/employee/000010
```

You should see the same results as before. A request from FRED does not work because when the pass ticket for FRED is sent to Db2 this user does not have sufficient authority. When the pass ticket for USER1 is sent to DB2 this user has sufficient authority to access Db2.

___ 3. View the *syslogall.log* file again and you should find two sets of the messages shown below. Each set of messages showing the AT-TLS policy has been triggered and the message sent from the z/OS Connect server has been protected with TLS. The handshakes were successful even though the request for FRED failed with Db2 security check.

```
EZD1281I TTLS Map CONNID: 000029DB LOCAL: 192.168.17.220..2445 REMOTE:

Handshake 0000005011527E10 0000005011522750 TLSV1.2 F0F0F3F5
```

The diagram below shows the flow of the request from the z/OS Connect server to Db2.

4. Here is an example of a handshake failure. The request failed with a return code of 202.

The key ring cannot be opened because the user does not have permission. Check the following items:

- Look at message EZD1281 to verify the user ID being used for this connection and the TTLSEnvironmentAction statement that is mapped to this connection. If you are configuring by using the IBM Configuration Assistant for z/OS® Communications Server, you can specify the key ring on either the AT-TLS: Image Level Settings panel or on each Traffic Descriptor.
- Ensure that the correct key ring is specified

5. The information in the AT-TLS Knowledge Center for describing AT-TLS return codes has the information displayed below for a 202 return code (see URL https://www.ibm.com/support/knowledgecenter/SSLTBW_2.4.0/com.ibm.zos.v2r4.hald001/comtls.htm_

```
EZD1281I TTLS Map CONNID: 0000247F LOCAL: 192.168.17.220..2445 REMOTE :

DB2USER RULE: Db2ServerRule~1 RC: 5006 Initial Handshake 0000000000000000
0000000000000000 0000000000000000 00000000
```

This simply means the user does not have the required access to either of the RACF FACILITY resources IRR.DIGTCERT.LIST and IRR.DIGTCERT.LISTING

Optional

Disable the use of RACF Passtickets and retest using only TLS and see what difference this makes.

Summary

In this step you have created an AT-TLS inbound policy which protects Db2's port 2445. This policy has a server surrogate for Db2 for TLS handshakes.

Appendix – AT-TLS Policy Agent Configuration File
