**Important:** On the desktop there is a file named *Security CopyPaste.txt*. This file contains commands and other text used in this workshop. Locate that file and open it. Use the copy-and-paste function (**Ctrl-C** and **Ctrl-V**) to enter commands or text. It will save time and help avoid typo errors. As a reminder text that appears in this file will be highlighted in yellow.

## ***General Exercise Information and Guidelines***

- ✓ This exercise requires the completion of the *zCEE Basic Configuration* and *zCEE Basic Security Configurations* exercises before it can be performed.
- ✓ This exercise requires using z/OS user identities *FRED* and *USER1*. The password for these users will be provided by the lab instructions.
- ✓ There are examples of *server.xml* scattered through this exercise. Your *server.xml* may differ depending on which exercises have been previously performed. Be sure the **red lines** in these examples are either added or already present.
- ✓ The acronyms RACF (resource access control facility) and SAF (system authorization facility) are used in this exercise. RACF is the IBM security manager product whereas SAF is a generic term for any security manager product, e.g. ACF2 or Top Secret or RACF. An attempt has been to use SAF when referring to information appropriate for any SAF product and to use RACF when referring to specific RACF commands or examples.
- ✓ Any time you have any questions about the use of IBM z/OS Explorer, 3270 screens, features or tools, do not hesitate to ask the instructor for assistance.
- ✓ Text in **bold** and highlighted in **yellow** in this document should be available for copying and pasting in a file named *Security CopyPaste* file on the desktop.
- ✓ Please note that there may be minor differences between the screen shots in this exercise versus what you see when performing this exercise. These differences should not impact the completion of this exercise.

## *Overview*

This exercise demonstrates the steps required to enable security between a z/OS Connect EE (zCEE) server and IMS.

In part one of the exercise the use of RACF pass tickets will be configured. RACF pass tickets can be used to pass the z/OS Connect authenticated RACF identity to IMS Connect and this identity will subsequently be used for IMS authorization checks.

In part two of the exercise, TLS support will be added by configuring AT-TLS policies. The presence of these policies will act as a surrogate for handing the server role on behalf of IMS Connect and a surrogate for the z/OS Connect server as client.

## Enabling RACF Pass Tickets

When sending request from an z/OS Connect server to IMS the identity used for IMS authorization checks will be by default the identity configured in the basic authentication element of the IMS connection factory. This identity is associated with the server and not the z/OS Connect authenticated identity under which the requests is running.

To provide identity assertion of the authenticated identity the use of RACF Pass Tickets is required. When RACF Pass Tickets are enabled, the zCEE server will obtain a pass ticket from RACF and send this ticket (token) along with the request to IMS Connect. When the request arrives at the IMS Connect the pass ticket will be validated with RACF and the z/OS Connect authenticated identity will be extracted and use for subsequent IMS authorization checks.

### Test with RACF Pass Tickets not enabled

But first let's explore invoking an IMS API and observing the security behavior when identity propagation is not enabled.

1. Edit the *server.xml* configuration file for the *myServer* server, e.g. */var/zosconnect/servers/myServer/server.xml* and add includes for *shared.xml* and *imsDatabase.xml* (if they are not already present) see below:

```
<include location="${server.config.dir}/includes/imsDatabase.xml"/>
```

```
<include location="${server.config.dir}/includes/shared.xml"/>
```

```
<include location="${server.config.dir}/includes/safSecurity.xml"/>
<include location="${server.config.dir}/includes/ipic.xml"/>
<include location="${server.config.dir}/includes/keyringMutual.xml"/>
<include location="${server.config.dir}/includes/groupAccess.xml"/>
<include location="${server.config.dir}/includes/imsDatabase.xml"/>
<include location="${server.config.dir}/includes/shared.xml"/>
```

This will install some predefined services and APIs in the server.

2. Stop and restart the server with MVS commands **P BAQSTRT** and **S BAQSTRT**.

**Tech-Tip:** MVS and JES2 commands can be entered from SDSF by enter a / (slash) on the command line followed by the command itself (e.g. /D T). The command results can be found in the system log. If a command is especially long, then simply entering a / (slash) to display a *SDSF – System Command Extension* panel where a command can span multiple lines. When an MVS command must be entered, the instructions in these exercises will indicate that the command is a MVS command and you may enter the command at the prompt by using the / (slash) prefix or using the *SDSF – System Command Extension* panel.

\_\_\_3. Open a DOS command prompt and go to directory *c:/z/admin*.

\_\_\_4. Enter the cURL command below:

```
curl -X get --cacert certauth.pem --cert fred.p12:secret --cert-type P12  
https://wg31.washington.ibm.com:9443/imdb/contact/LAST3
```

```
c:\z\admin>curl -X get --cacert certauth.pem --cert fred.p12:secret --cert-type P12  
https://wg31.washington.ibm.com:9443/imdb/contact/LAST3  
{ "response": { "result": [ { "firstName": "FIRST3", "zipCode": "D03\ /R03", "lastName": "LAST3", "  
phoneNumber": "8-111-3333" } ] } }
```

\_\_\_5. Enter the cURL command below:

```
curl -X GET --cacert certauth.pem --cert user1.p12:secret --cert-type P12  
https://wg31.washington.ibm.com:9443/imdb/contact/LAST3
```

You should see the same results because the requests to IMS Connect are using the basic authentication as configured in the connection factory in *imsDatabase.xml* (see below).

```
<connectionFactory id="DFSIVPAConn">  
<properties.imsudbJLocal  
  databaseName="DFSIVPA"  
  dataStoreName="IVP1"  
  dataStoreServer="wg31.washington.ibm.com"  
  driverType="4"  
  portNumber="5555"  
  user="USER1"  
  password="USER1"  
  flattenTables="True"/>  
</connectionFactory>
```

\_\_\_6. To confirm that USER1 is being used, locate the outstanding reply for IMS Connect in the SDSF log and respond with **VIEWHWS**, as in ##VIEWHWS (where ## is the reply number). You should see two requests for port 5555 both with the same *CLIENTID* of *USER1*.

```
HWSC0001I      PORT=5555D      STATUS=ACTIVE      KEEPAPV=0  NUMSOC=3  
EDIT=          TIMEOUT=6000  
HWSC0001I      CLIENTID USERID      TRANCODE  DATASTORE  STATUS      SECOND  
CLNTPORT IP-ADDRESS      APSB-TOKEN  
HWSC0001I      ODB970D4  USER1      IVP15OOD  RECV        44  
1423  192.168.017.220  
HWSC0001I      ODB36ED4  USER1      IVP15OOD  RECV        153  
1349  192.168.017.220  
HWSC0001I      TOTAL CLIENTS=2  RECV=2  READ=0  CONN=0  XMIT=0  OTHER=0
```

## *Test with identity propagation enabled using RACF Pass Tickets*

Next enable the use of RACF pass tickets in the server.xml file and retest and the observe the results.

\_\_\_1. Begin by submit the job in member *IMSPTKT* in data set *USER1.ZCEE30.CNTL*.

```
ADDGROUP ZCEEIMS

CONNECT (FRED,USER1,LIBSERV GROUP(ZCEEIMS)

SETROPTS CLASSACT(PTKTDATA) RACLIST(PTKTDATA)
SETROPTS GENERIC(PTKTDATA)

RDEFINE PTKTDATA IMSAPPL SSIGNON(KEYMASK(123456789ABCDEF0)) +
APPLDATA('NO REPLAY PROTECTION')

RDEFINE PTKTDATA IRRPTAUTH.IMSAPPL.* UACC(NONE)
PERMIT IRRPTAUTH.IMSAPPL.* ID(ZCEEIMS) CLASS(PTKTDATA) ACC(UPDATE)

SETROPTS RACLIST(PTKTDATA) REFRESH
```

These commands define the required *PTKTDATA* resource *IMSAPPL*.

**Tech-Tip:** The value *IMSAPPL* was derived from the IMS Connect *APPL* attribute for the ODACCESS configuration entry, see sample below:

```
HWS=(ID=IMS15HWS,XIBAREA=100,RACF=Y,RRS=Y)
TCPIP=(HOSTNAME=TCPIP,PORTID=(4000,LOCAL),RACFID=JOHNSON,TIMEOUT=5000)
DATASTORE=(GROUP=OTMAGRP,ID=IVP1,MEMBER=HWSMEM,DRU=HWSYDRU0,
TMEMBER=OTMAMEM,APPL=IMSAPPL)
ODACCESS=(ODBMAUTOCONN=Y,IMSPLEX=(MEMBER=IMS15HWS,TMEMBER=PLEX1),
DRDAPORT=(ID=5555,PORTTMOT=6000),ODBMTMOT=6000,APPL=IMSAPPL)
```

The value for the key mask was an arbitrary 16 hexadecimal string. If multiple RACF databases are involved this value must be the same for all.

- \_\_\_2. Edit the server's server.xml file and change the include for *imsdatabase.xml* to an include for *imsDatabasePassTicket.xml*.

```
<include location="${server.config.dir}/includes/imsDatabasePassTicket.xml"/>
```

```
<include location="${server.config.dir}/includes/safSecurity.xml"/>
<include location="${server.config.dir}/includes/ipic.xml"/>
<include location="${server.config.dir}/includes/keyringMutual.xml"/>
<include location="${server.config.dir}/includes/groupAccess.xml"/>
<include location="${server.config.dir}/includes/imsDatabasePassTicket.xml"/>
<include location="${server.config.dir}/includes/shared.xml"/>
```

The contents of *imsDatabasePassTicket.xml* are shown below

```
<connectionFactory id="DFSIVPAConn">
<properties.imsudbJLocal
  databaseName="DFSIVPA"
  dataStoreName="IVP1"
  dataStoreServer="wg31.washington.ibm.com"
  driverType="4"
  portNumber="5555"
  applicationName="IMSAPPL"
  flattenTables="True"/>
</connectionFactory>
```

- \_\_\_3. Refresh the server's configuration using the MVS command **F BAQSTRT,REFRESH,CONFIG**

**Tech-Tip:** A refresh should be sufficient, but a complete restart of the server might be better. The TCPIP connects linger for a while and restart of the server will break these connections and provide distinct results between tests.

- \_\_\_4. Enter the cURL command below:

```
curl -X get --cacert certauth.pem --cert fred.p12:secret --cert-type P12
https://wg31.washington.ibm.com:9443/imdb/contact/LAST3
```

```
c:\z\admin>curl -X get --cacert certauth.pem --cert fred.p12:secret --cert-type P12
https://wg31.washington.ibm.com:9443/imdb/contact/LAST3
{"response":{"result":[{"firstName":"FIRST3","zipCode":"D03\R03","lastName":"LAST3","
phoneNumber":"8-111-3333"}]}}
```

:

You should see the same results.

- \_\_\_5. To confirm the FRED identity (fred.p12) is being used, locate the outstanding reply for IMS Connect in the SDSF log again and respond with IMS Connect command *VIEWHWS*, as in *##VIEWHWS* (where *##* is the outstanding reply number for IMS Connect). You should see two requests for port 5555, with one *CLIENTID* for FRED and another *CLIENTID* for USER1.

HWSC0001I	PORT=5555D	STATUS=ACTIVE	KEEPAV=0	NUMSOC=3		
EDIT=	TIMEOUT=6000					
HWSC0001I	CLIENTID	USERID	TRANCODE	DATASTORE	STATUS	SECOND

			OTHER=0			

## Summary

In this section a simple REST client (cURL) has been used to invoke an API which accesses IMS. The API was initially tested without using RACF Pass Tickets using basic authentication from the server. Required RACF resources were then defined and changes were made to the server.xml so RACF Pass Tickets would be used between the server and IMS Connect. Finally, the REST client was used to demonstrate that the identity associated with the client certificates (fred.p12 and user1.p12) were propagated to IMS Connect for authorization checks.

## Configuring TLS security to an IMS Subsystem

Adding TLS support to the connection between the z/OS Connect server and IMS requires the creation of a key ring belonging to the identity under which the IMS Connect task is executing (look for message IEF695I in the IMS15HWS task's JES messages). This key ring contains the personal and the certificate authority certificates that will be used during TLS handshakes. The creation of the key ring and the connection of certificates to the key ring are done using the RACDCERT RACF commands.

### Creating IMS SAF resources

First, we may have to do some housekeeping depending on which exercises have been previously performed.

- \_\_\_1. Browse data set *USER1.ZCEE30.CNTL*. You should see the members in that data set.
- \_\_\_2. Browse member **ZCEETLSC** (TLS client role). You should see the RACF commands below. Submit the job for execution if this job has not been previously submitted in another exercise.

```
/* Create personal certificate for zCEE outbound client request */
racdcert id(libserv) gencert subjectsdn(cn('zCEE Client Cert') +
ou('ATS') o('IBM')) withlabel('zCEE Client Cert') signwith(certauth +
label('zCEE CA')) notafter(date(2022/12/31))

/* Create zCEE outbound key ring and connect certificates */
racdcert id(libserv) addring(zCEE.KeyRing)

racdcert id(libserv) connect(ring(zCEE.KeyRing) +
label('zCEE CA') certauth usage(certauth))

racdcert id(libserv) connect(ring(zCEE.KeyRing) +
label('Liberty CA') certauth usage(certauth))

/* Connect CA certificate to Liberty inbound key ring */
racdcert id(libserv) connect(ring(Liberty.KeyRing) +
label('zCEE CA') certauth usage(certauth))

/* Connect default personal certificate */
racdcert id(libserv) connect(ring(zCEE.KeyRing) +
label('zCEE Client Cert') default)

racdcert id(libserv) listring(zCEE.KeyRing)
racdcert id(libserv) list

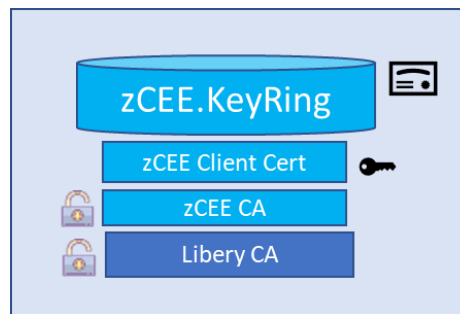

setr raclist(digtcert digtring) refresh

connect    libserv  group(zceeusrs)
connect    libserv  group(gminvoke)
```

These commands

- Define a personal certificate for the zCEE server for use during outbound handshakes.
- Define a key ring to be used for outbound handshakes.
- Connect the zCEE server personal certificate to this key ring.
- Connect the certificate authority (CA) public certificate used to sign the zCEE server's outbound personal certificate to this key ring.
- Connect the certificate authority (CA) public certificate used to sign the API provider server's certificate to this key ring.
- Connects the certificate authority (CA) public certificate used to sign the zCEE server's outbound personal certificate to the API provider's key ring.
- User LIBSERV is given the required authority to access their key ring and certificate.
- The in-storage profile for digital certificates resources are refreshed.
- User LIBSERV is connected to the groups that provide access to this zCEE instance.

Below is visual representation of the key ring just created

3. Edit the *server.xml* configuration file for the *myServer* server, located in directory */var/zosconnect/servers/myServer* and change the include for file *keyringMutual.xml* to an include of file *keyringOutboundMutua.xml*, see below:

```
<include location="/${server.config.dir}/includes/keyringOutboundMutual.xml"/>
```

\_\_\_4. Next, browse member **IMSTLS**, you should see the RACF commands below. Submit the job for execution.

```
/* Create a CA certificate for IMS */
racdcert certauth gencert subjectsdn(cn('IMS CA') ou('ATS') +
ou('ATS') o('IBM')) withlabel('IMS CA') keyusage(certsign) +
notafter(date(2022/12/31))

/* Create a server certificate for IMS client request */
racdcert id(IMSSTC) gencert subjectsdn(cn('wg31.washington.ibm.com') +
ou('ATS') o('IBM')) withlabel('IMSSTC') signwith(certauth +
label('IMS CA')) notafter(date(2021/12/31))

setr raclist(digtcert,digtnmap) refresh

/* Create IMS key ring and connect CA and personal certificates */
racdcert id(IMSSTC) addring(IMS.KeyRing)

racdcert id(IMSSTC) connect(ring(IMS.KeyRing) +
label('IMS CA') certauth usage(certauth))

racdcert id(IMSSTC) connect(ring(IMS.KeyRing) +
label('zCEE CA') certauth usage(certauth))

racdcert id(libserv) connect(ring(zCEE.KeyRing) +
label('IMS CA') certauth usage(certauth))

/* Connect default personal certificate */
racdcert id(IMSSTC) connect(ring(IMS.KeyRing) +
label('IMSSTC') default

setropts raclist(digtring,digtnmap) refresh
```

These commands

- Define a certificate authority certificate used to sign IMS certificates used during TLS handshakes.
- Define a personal certificate for the IMS server for use during TLS handshakes.
- Define a key ring to be used for TLS handshakes.
- Connect the IMS server personal certificate to this key ring.
- Connect the certificate authority (CA) public certificate used to sign the IMS server's certificate to this key ring.
- Connect the certificate authority (CA) public certificate used to sign the zCEE server's outbound personal certificate to this key ring.
- The in-storage profile for digital certificates resources are refreshed.

Below is visual representation of the key ring just created

The update made to the zCEE server's outbound keyring

And the handshakes will flow as shown below

1. Edit the *server.xml* configuration file for the *myServer* server, found in directory */var/zosconnect/servers/myServer* and change the include for file *keyringMutual.xml* to an include of file *keyringOutBoundMutual.xml*, see below:

```
<include location="${server.config.dir}/includes/keyringOutboundMutual.xml"/>
```

```
<include location="${server.config.dir}/includes/safSecurity.xml"/>
<include location="${server.config.dir}/includes/ipicIDProp.xml"/>
<include location="${server.config.dir}/includes/keyringOutboundMutual.xml"/>
<include location="${server.config.dir}/includes/groupAccess.xml"/>
<include location="${server.config.dir}/includes/apiRequesterHTTPS.xml"/>
<include location="${server.config.dir}/includes/imsDatabasePassTicket.xml"/>
<include location="${server.config.dir}/includes/db2.xml"/>
<include location="${server.config.dir}/includes/shared.xml"/>
```

```
<!-- Enable features -->
<featureManager>
  <feature>transportSecurity-1.0</feature>
</featureManager>

<sslDefault sslRef="DefaultSSLSettings"
  outboundSSLRef="OutboundSSLSettings" />

<ssl id="DefaultSSLSettings"
  keyStoreRef="CellDefaultKeyStore"
  trustStoreRef="CellDefaultKeyStore"
  clientAuthenticationSupported="true"
  clientAuthentication="true"/>

<keyStore id="CellDefaultKeyStore"
  location="safkeyring:///Keyring.LIBERTY"
  password="password" type="JCERACFKS"
  fileBased="false" readOnly="true" />

<ssl id="OutboundSSLSettings"
  keyStoreRef="OutboundKeyStore"
  trustStoreRef="OutboundKeyStore" />

<keyStore id="OutboundKeyStore"
  location="safkeyring:///zCEE.KeyRing"
  password="password" type="JCERACFKS"
  fileBased="false" readOnly="true" />
```

- \_\_\_2. Enter MVS commands *P BAQSRT and S BASSTR* to refresh the zCEE server's runtime configuration.

**Tech-Tip:** Updates to keyrings could have been refreshed in the server by using this command :

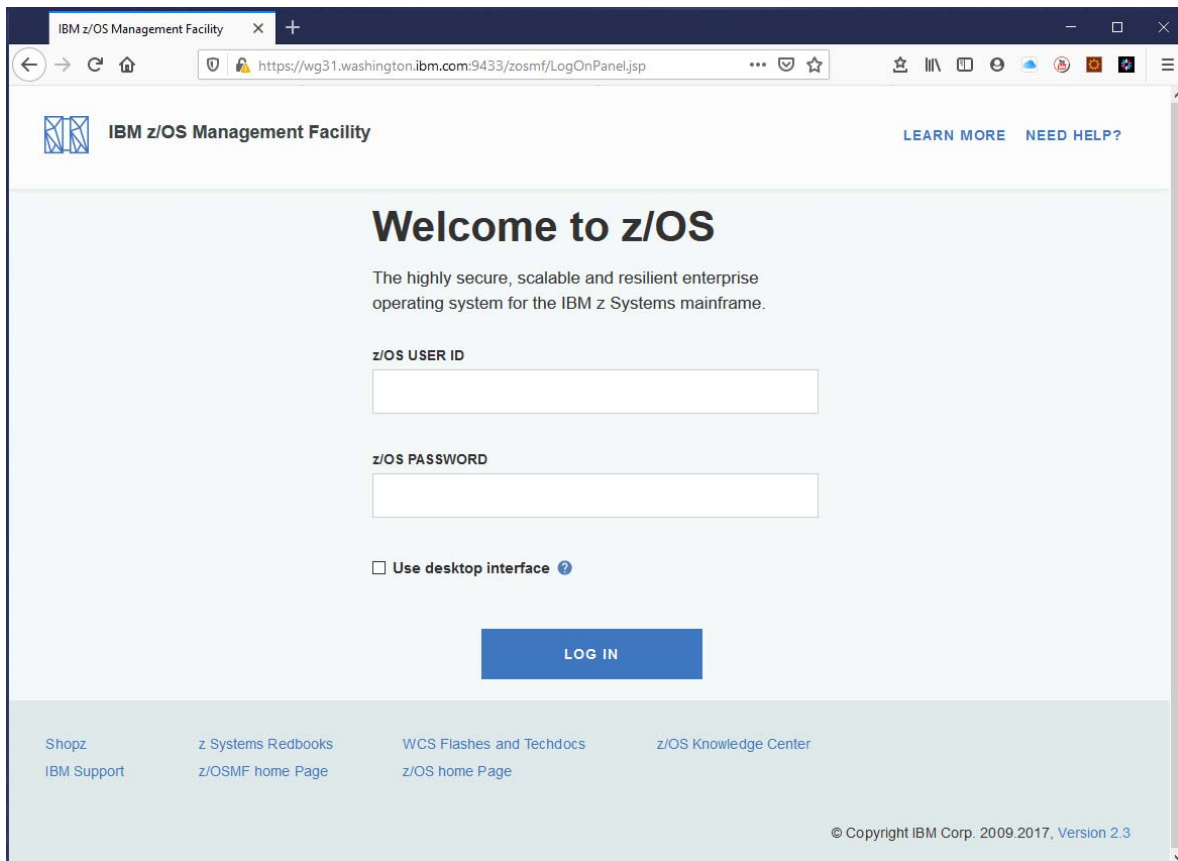

*F BAQSTR,REFRESH,KEYSTORE*

This would have dynamically made the information about CICS CA certificate available in the zCEE runtime

## Configure the AT-TLS policies

z/OSMF will be used in this section to configure the AT-TLS configuration for the desired inbound and outbound policies.

1. In a Firefox browser enter URL <https://wg31.washington.ibm.com:9433/zosmf> and you should see the *IBM z/OS Management Facility* window.

Note that some of the AT-TLS configuration steps described here may have been performed in another exercise.

2. Enter *USER1* as the *z/OS USER ID* and *USER1*'s password and click the **LOG IN** button.

- \_\_\_3. The *Welcome* screen should be displayed. On the left-hand side expand the *Configuration* tab to expose the *Network Configuration Assistance* option. Select this option to expose the *Network Configuration* tab.

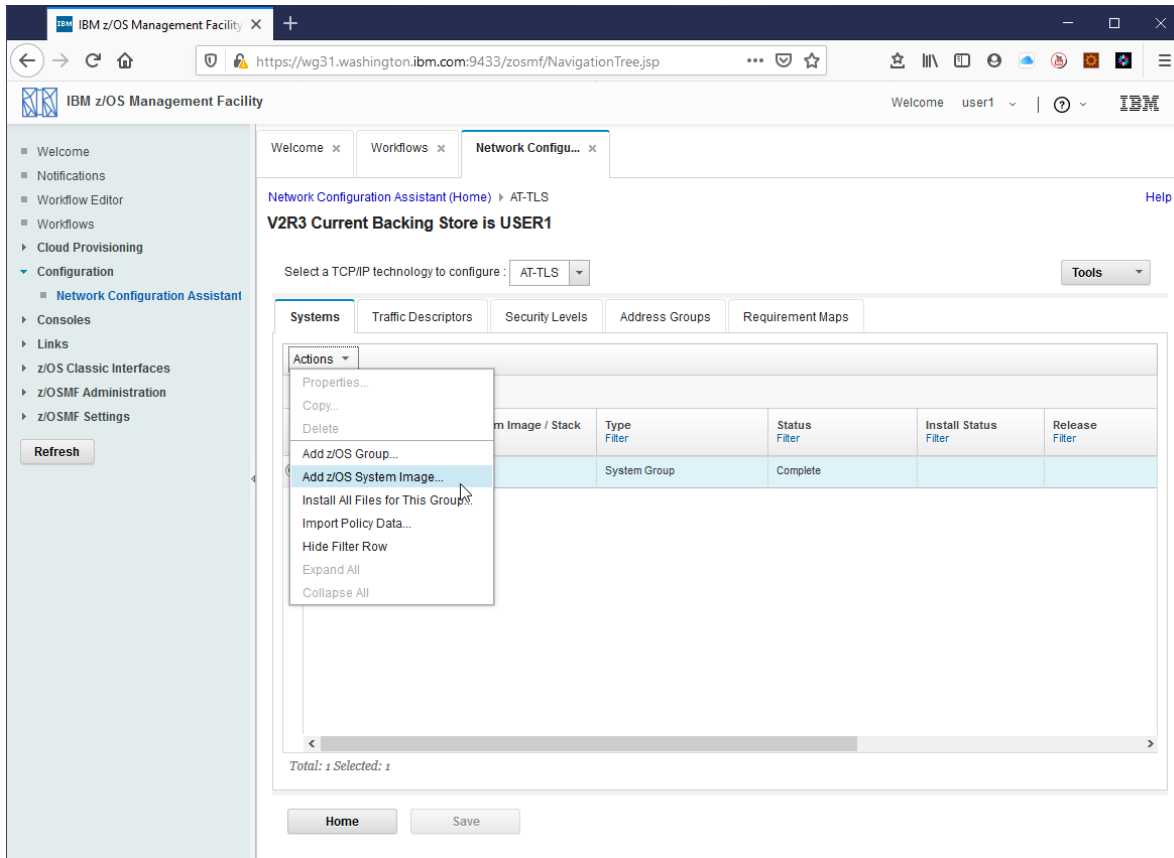

- \_\_\_4. Select the radio button beside *Create or transfer a new backing store* option and click the **Proceed** button.
- \_\_\_5. On the next screen select the radio button beside *Create a New Backing Store File* and enter **USER1** in the area beside *File Name*. Press the **OK** button and press the **OK** button on the Information pop-up.

\_\_\_6. On the *Network Configuration* tab use the pull-down arrow to select *AT-TLS* as the *TCP/IP technology* to configure.

- \_\_\_7. Select the radio button beside the *Default - System Group* and use the *Action* pull-down button to select *Add z/OS System Image* option.

- \_\_\_8. On the *Add z/OS System Image* window enter **WG31** for the image *Name* and check the radio button beside *Simple name (as in an SAF product...)* and enter **Liberty.KeyRing** as the default AT-TLS key ring name. Click **OK** to continue.

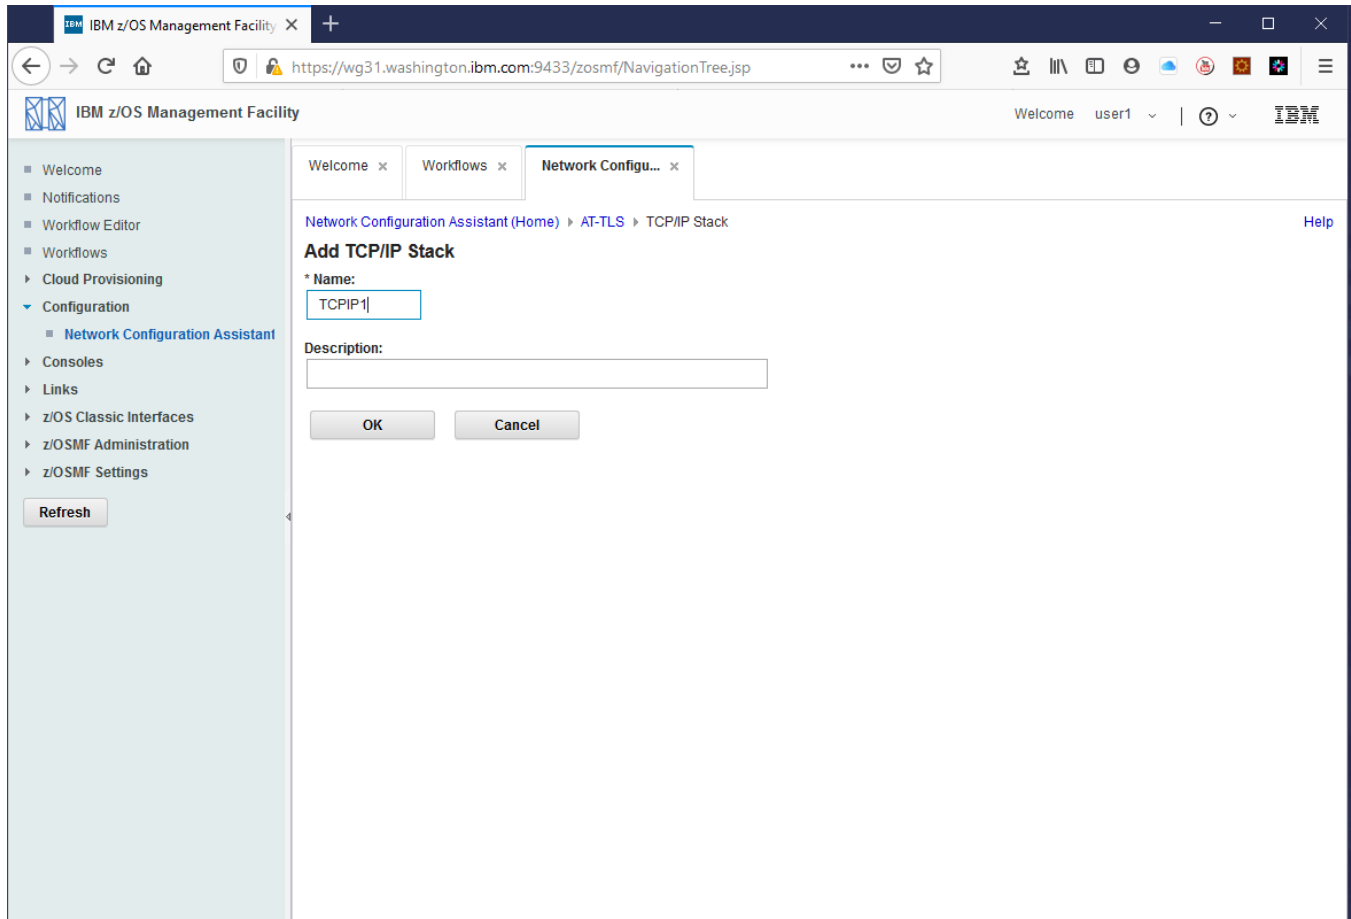

The screenshot shows the 'Add z/OS System Image' window in the IBM z/OS Management Facility. The 'Name' field is set to 'WG31'. The 'z/OS Release' is set to 'V2R3'. Under the 'Default AT-TLS key ring database' section, the 'Simple name (as in an SAF product or in PKCS #11 token format)' radio button is selected, and the 'Key ring' field is set to 'Liberty.KeyRing'. The 'OK' and 'Cancel' buttons are at the bottom.

**Tech Tip:** The value for the key ring will be used if an explicit key ring is not provided for a policy in a *Traffic Descriptor*.

We recommend establishing a naming convention for key rings with each SAF identity using the same key ring name in the same context. Using this name as an example you could create a unique key ring named *Liberty.KeyRing* for SAF identities USER1, USER2, FRED, etc. Each user's key ring would have the same name but a different set of connected certificates. One default key ring specified at the image level covers all users.

- \_\_\_9. On the *Proceed to the Next Step?* pop-up click the **Proceed** button.

- \_\_\_10. The *Add TCP/IP Stack* screen should be displayed. Select this option to expose the *Network Configuration* tab. Enter **TCPIP1** as the name of the stack. Click **OK** to continue.

**Tech-Tip:** The value for the stack name was determined by the TCPIP Name display by entering the MVS command D TCPIP.

```
EZAOP50I TCPIP STATUS REPORT 007
COUNT   TCPIP NAME   VERSION   STATUS
-----
      1   TCPIP1      CS V2R3   ACTIVE
*** END TCPIP STATUS REPORT ***
EZAOP41I 'DISPLAY TCPIP' COMMAND COMPLETED SUCCESSFULLY
```

- \_\_\_11. Before any TCP/IP stack rules can be added, *Traffic Descriptors*, *Address Groups* and *Requirement Maps* need to be defined. Click **Cancel** on the *Proceed to the Next Step?* displayed at this time.

- \_\_\_12. This will display the window below:

**Tech Tip:** The **Incomplete** warning will be addressed shortly.

13. Select the radio button beside *WG31* and use the *Actions* pull-down to select *Properties*. On the *Modify z/OS System Image* window select the *System Image Level Settings* tab and check all the trace level boxes as shown below. This is being done so we can confirm AT-TLS is being invoked and identify issues. Press **OK** to continue.

\_\_\_14. Select the *Traffic Descriptors* tab and use the *Actions* pull-down to select *New*.

15. On the *New Traffic Descriptor* window enter **IMSConnectDB** as the name and use the *Actions* pull-down and select *New* to start the definition of a new traffic descriptor type.

IBM z/OS Management Facility on WG31.DMZ — Mozilla Firefox

IBM z/OS Management Facility

Welcome user1

Network Configuration Assistant (Home) > AT-TLS > Traffic Descriptor

### New Traffic Descriptor

Traffic descriptors contain details of traffic types which are mapped to security levels within requirement maps. A traffic descriptor can contain a single type of traffic or multiple types of traffic.

\* Name:

Description:

List of traffic types in this traffic descriptor

Protocol	Local Port	Remote Port	Connect Direction	Job Name	User ID
There is no data to display.					

Total: 0 Selected: 0

OK Cancel

16. On the *New Traffic Type – TCP* window select the radio button beside *Single ports* under *Local port* and enter **5555** as the port number. Select the radio button *All ports* under *Remote port*. Select the radio button beside *Inbound only* under *Indicate the TCP connection direction*. Enter **IMS15HWS** in the area under *Jobname* and finally select the radio button beside *Server* under *AT-TLS Handshake Role*. Next click on the *KeyRing* tab to continue.

The screenshot shows the IBM z/OS Management Facility Network Configuration Assistant (Home) - AT-TLS - Traffic Descriptor - Traffic Type - TCP. The 'New Traffic Type - TCP' window is open, showing configuration options for Local port, Remote port, TCP connection direction, Jobname, User ID, and AT-TLS Handshake Role.

**Local port:**

- ☐ All ports
- ☒ Single port (5,555)
- ☐ Port range (Lower port: 100, Upper port: 101)
- ☐ Ephemeral ports

**Remote port:**

- ☒ All ports
- ☐ Single port (100)
- ☐ Port range (Lower port: 100, Upper port: 101)
- ☐ Ephemeral ports

**Indicate the TCP connect direction:**

- ☐ Either
- ☒ Inbound only
- ☐ Outbound only

**Jobname:** IMS15HWS

**User ID:**

**AT-TLS Handshake Role:**

- ☒ Server
- ☐ Client

Client authentication role is set in the security level.

Buttons: OK, Cancel

**Tech-Tip:** This traffic definition is triggered when a client attempts to connect to port 5555. Port 5555 was identified in the IMS Connect configuration.

 ODACCESS=(ODBMAUTOCONN=Y,IMSPLEX=(MEMBER=IMS15HWS,TEMEMBER=PLEX1),  
 DRDAPORT=(ID=5555,PORTTMOT=6000),ODBMTMOT=6000,APPL=IMSAPPL)

If all the defined conditions are met, AT-TLS will act as a surrogate for the server during a TLS handshake. Note the *KeyRing* tab can be used to specify the name of the key ring to be used for this handshake, e.g. IMS.KeyRing. Otherwise the default is to use the same key ring name defined for the z/OS System image, e.g. Liberty.KeyRing.

- \_\_\_17. On the *KeyRing* tab select the radio button beside *Use a Simple name* and enter **IMS.KeyRing** as the key ring name. Click **OK** twice to continue.

### New Traffic Type - TCP

Details KeyRing Advanced

Specify the key ring database to use for the traffic type specified on the Details tab.

☐ Use the key ring database defined for the z/OS system image.

☒ Use a Simple name (as in a SAF product or in PKCS #11 Token format):

\* Key ring:

IMS.KeyRing

☐ Use this z/OS UNIX file system key database:

\* Key database:

\* Key database stash file:

\* Key database password:

Certificate Label:

☐ Specified server certificate labels to be used by server to accommodate clients with different types of public keys. The certificates are in V2R3.

Actions

Certificate Label

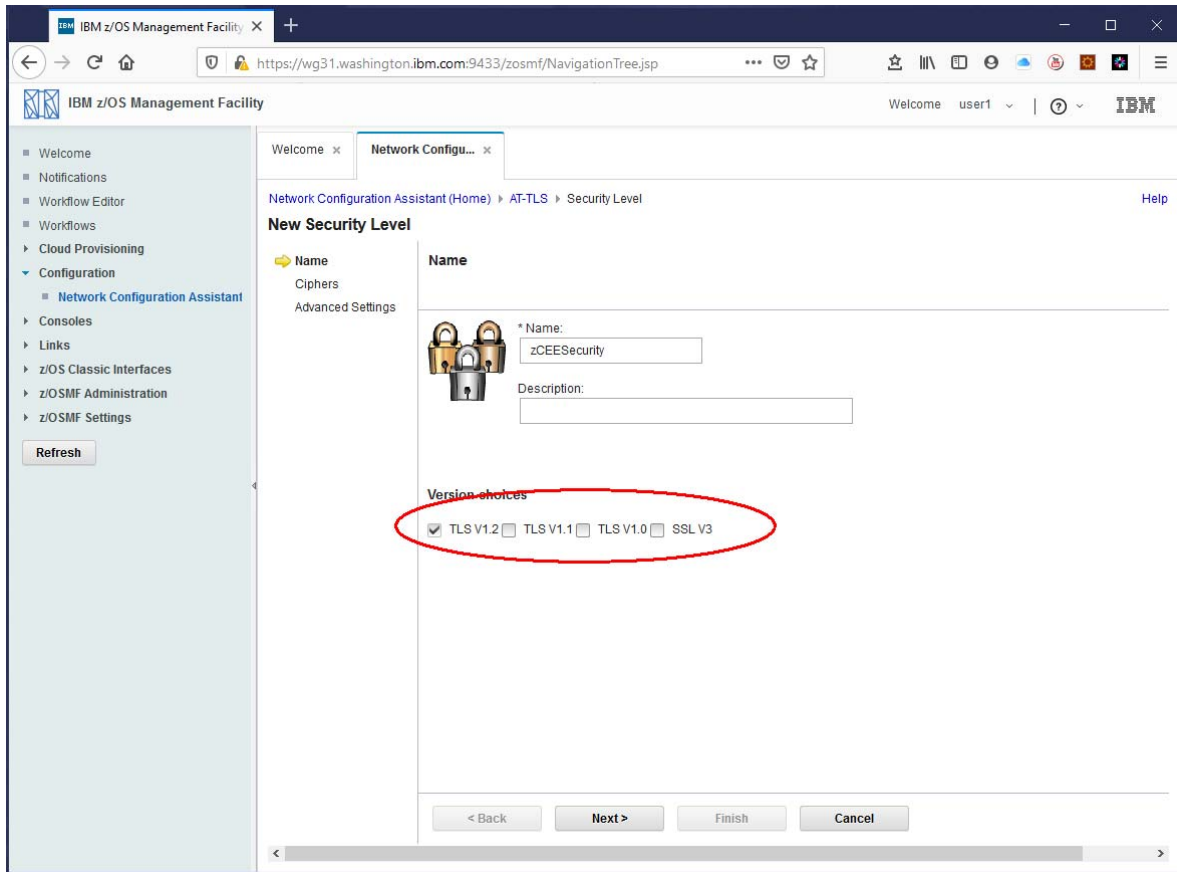

**Tech Tip:** The key ring specified here belongs to identity IMSSTC. This is the identity under which the IMS Connect task is running. This ring has these certificates connected.

Ring:

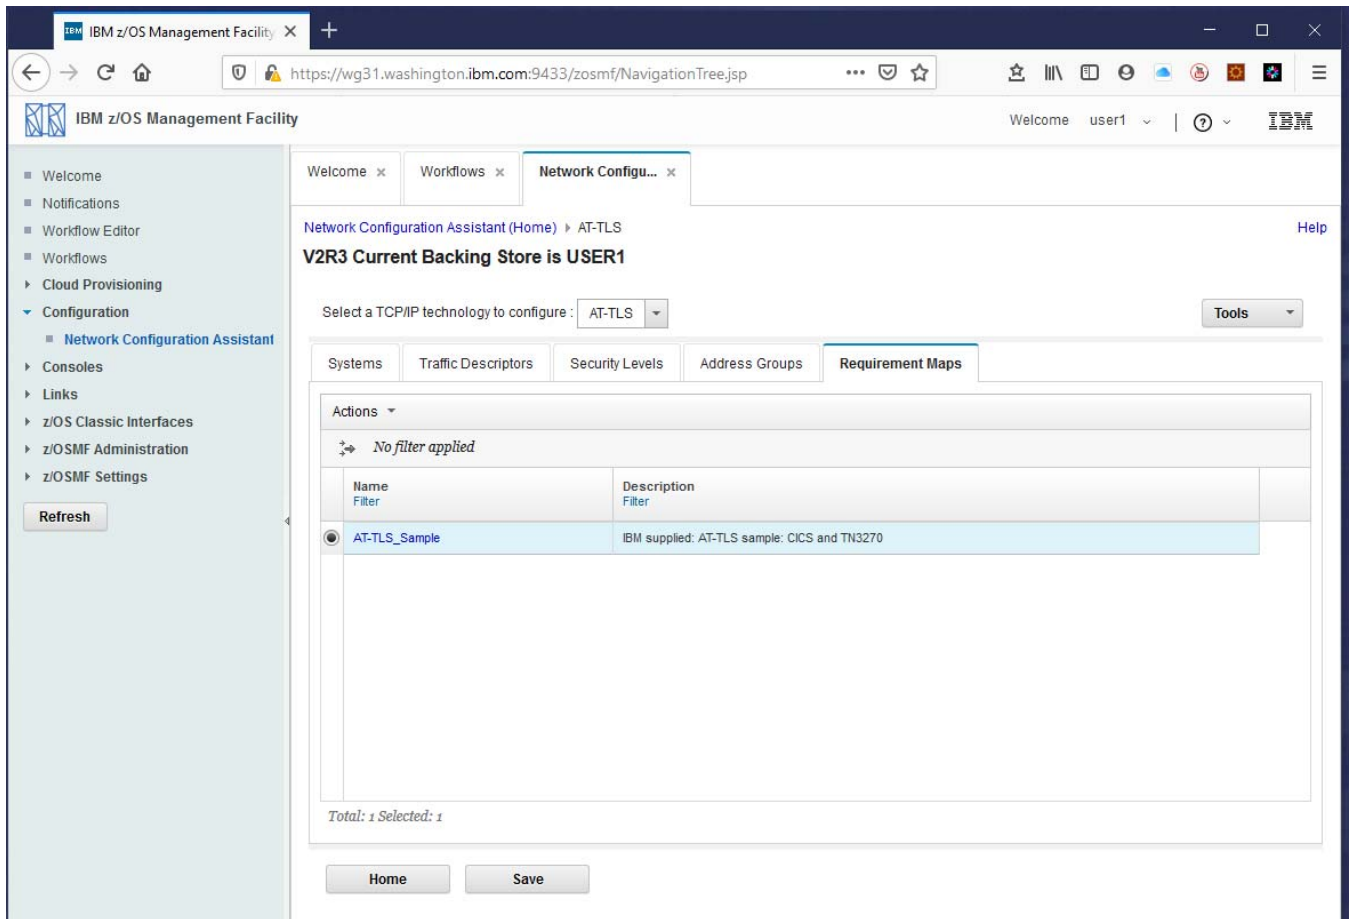

```
>IMS.KeyRing<
```

Certificate Label Name	Cert Owner	USAGE	DEFAULT
IMS CA	CERTAUTH	CERTAUTH	NO
zCEE CA	CERTAUTH	CERTAUTH	NO
IMSSTC	ID ( IMSSTC )	PERSONAL	YES

18. Next, click the *Security Levels* tab and use the *Actions* pull-down button and to select the *New* option. On the *New Security Level* windows, enter **zCEESecurity** for the *Name* and check the box beside *TLS V1.2* and uncheck the other boxes. Click **Next** to display the *Cipher selection* options. Click **Next** to display the *Advanced Settings* options exploring as you like but there is no need to make any changes. Click **Finish** to continue.

\_\_\_19. Next, click the *Requirement Maps* tab. Use the *Actions* pull-down button and to select the *New* option.

### Modify Requirement Map

A requirement map is an object that maps each IP traffic type (traffic descriptor) to a specific level of security (security level).

To add a new mapping to the requirement map:

1. Click the "Add Row" action or use an existing row
2. Click a table cell to select a traffic descriptor from the list
3. Click a table cell to select a security level from the list

\* Name:  
IMSDBRequirementMap

Description:

Mappings table

Actions		Move Up	Move Down
	Traffic Descriptor	Security Level	
<input type="radio"/>	IMSConnectDB	zCEESecurity	

Total: 1 Selected: 0

OK Cancel

- \_\_\_21. Select the radio button beside *IMSDBRequirementMap*. Use the *Actions* pull-down to select the *View Details* options to display the window below. Review the details and click the **Close** button to continue.

The screenshot shows the IBM z/OS Management Facility Network Configuration Assistant (Home) > AT-TLS > View Details. The page displays the 'View Details' for the 'Application / Requirement Map: IMSDBRequirementMap'. It includes a 'Requirement map summary' table, a 'Requirement Map traffic - Shown in Configured Order' table, and 'Security Level Details' for 'zCEESESecurity'.

**Requirement map summary**

Traffic Descriptor	AT-TLS Security Level
IMSConnectDB	zCEESESecurity

**Requirement Map traffic - Shown in Configured Order**

Traffic Descriptor					AT-TLS Security Level	
Name	Protocol	Local Port	Remote Port	Connect Direction	Name	Ciphers
IMSConnectDB	TCP	5555	All Ports	Inbound	zCEESESecurity	TLS Version 1: System SSL V3 Defaults

**Security Level Details**

**Security Level: zCEESESecurity**

Type:  
AT-TLS

Encryption:  
System SSL V3 Defaults

Use TLS Version 1.0:  
No

Use TLS Version 1.1:  
Yes

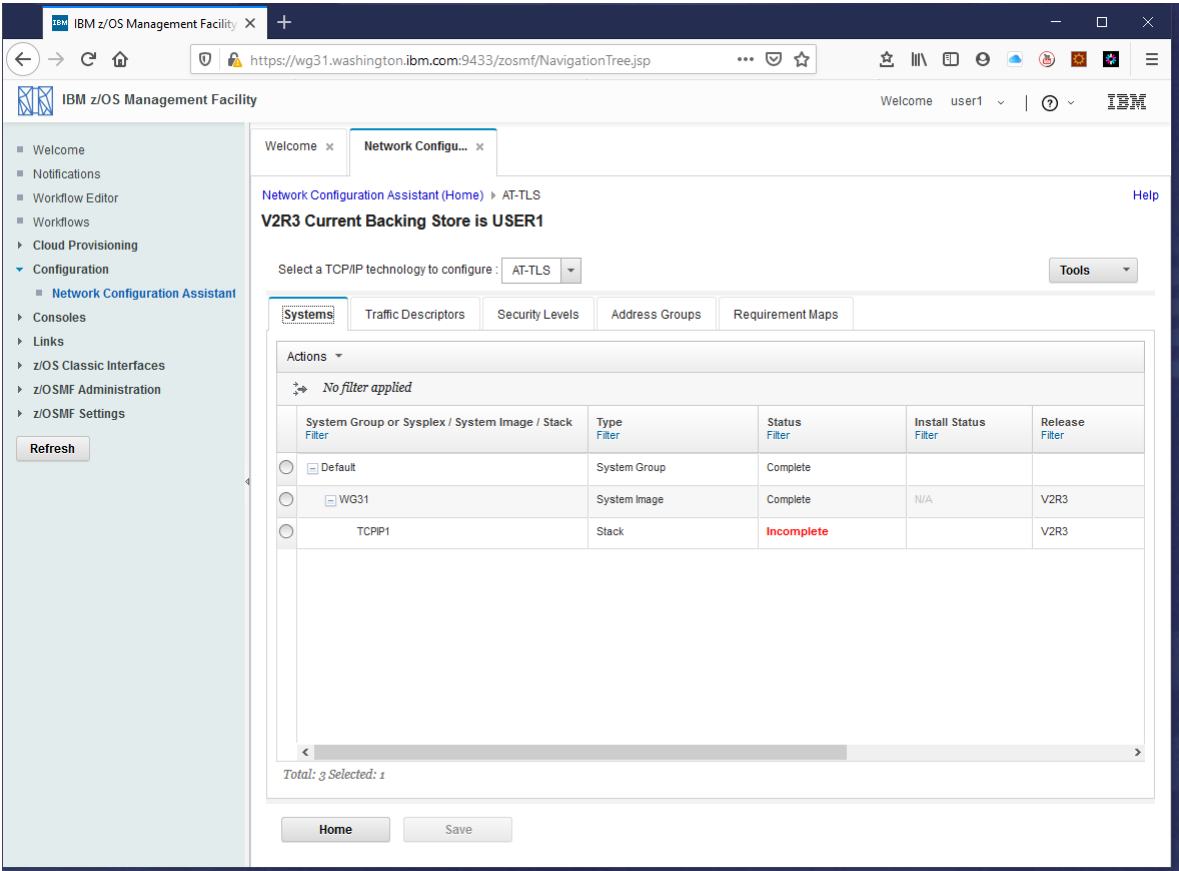

Use TLS Version 1.2:  
Yes

Use SSL Version 3:  
No

Buttons: Close, Back to Top

- \_\_\_22. Click the **Save** button to save the configuration.

23. When the save has complete click on the *Systems* tab to return to this window.

24. Select the radio button beside *TCPIPI*. Use the *Actions* pull-down to select *Rules*. This is where these definitions will be tied together. Use the *Actions* pull-down again and select *New* to create a new connectivity rule. Enter **IMSDBCConnectRule** for the *Connectivity rule name* and press **Next** to continue.

IMS CA	CERTAUTH	CERTAUTH	NO

\_\_\_31. Next, click the *Requirement Maps* tab. Use the *Actions* pull-down button and to select the *New* option.

The screenshot shows the IBM z/OS Management Facility web interface in a Mozilla Firefox browser. The address bar shows the URL: `https://wg31.washington.ibm.com:9433/zosmf/NavigationTree.jsp`. The page title is "IBM z/OS Management Facility". The left navigation pane includes sections like Welcome, Notifications, Workflow Editor, Workflows, Cloud Provisioning, Configuration (with "Network Configuration Assistant" selected), Consoles, Links, z/OS Classic Interfaces, z/OSMF Administration, and z/OSMF Settings. A "Refresh" button is at the bottom of the left pane.

The main content area has tabs for "Welcome", "Network Configu...", and "Requirement Maps" (which is active). Below the tabs, it says "Network Configuration Assistant (Home) > AT-TLS" and "V2R3 Current Backing Store is USER1". A dropdown menu "Select a TCP/IP technology to configure:" is set to "AT-TLS". A "Tools" dropdown is also visible.

Below these are tabs for "Systems", "Traffic Descriptors", "Security Levels", "Address Groups", and "Requirement Maps" (active). Under the "Requirement Maps" tab, there is an "Actions" dropdown menu with "No filter applied". Below this is a table with two columns: "Name" and "Description".

Name Filter	Description Filter
<input type="radio"/> IMSRequirementMap	
<input type="radio"/> AT-TLS_Sample	IBM supplied: AT-TLS sample: CICS and TN3270

At the bottom of the table area, it says "Total: 2 Selected: 0". Below the table are "Home" and "Save" buttons.

32. On the *New Requirement Map* window enter **IMSDBClientRequirementMap** as the *Name*. Use the pull-down arrows to select **IMSDBClient** as the *Traffic Descriptor* and **zCEESecurity** as the *Security Level* for this map. Click **OK** to continue.

Total: 1 Selected: 1

Close

\_\_\_40. On the *Install File for Default.WG31.TCPIP1* window click the **GO** button to continue.

\_\_\_41. Click **OK** twice to continue.

\_\_\_42. Next click on *AT-TLS* as shown below to return to the primary window.

\_\_\_43. The AT-TLS configuration has been completed and is installed. But it is not active yet.

## Activating the AT-TLS configuration

The AT-TLS configuration has been saved in an OMVS file but has not been installed in an active policy agent task (e.g. PAGENT).

- \_\_\_1. This instance of the policy agent has been configured to use the *SYSLOGD* daemon task to log messages

```
//PAGENT EXEC PGM=PAGENT,REGION=0K,TIME=NOLIMIT,
//  PARM='ENVAR("_CEE_ENVFILE_S=DD:STDENV")/-I SYSLOGD'
```

- \_\_\_2. The *SYSLOGD* daemon has been configured to write all log messages to file */var/syslogd/syslogall.log* (see the *syslog.conf* file in the */etc* subdirectory).

```
#####
#
# Write all messages with priority err and higher to log file errors.
#
#*.err                /var/log/%Y/%m/%d/errors
*.*                  /var/syslogd/syslogall.log
#
```

- \_\_\_3. Use ISPF option 3.4 to access directory */var/syslogd* and the *v* line command to view *syslogall.log*. Go the bottom of the file and you will see something like what is shown below:

```
VIEW /SYSTEM/var/syslogd/syslogall.log Columns 00063 00134

***** Bottom of Data *****
MA C 04/015
Connected to remote server/host wg31 using lu/pool TCP00109 and port 23
```

- \_\_\_4. Start the policy agent task using MVS command *S PAGENT*
- \_\_\_5. Exit the syslogall.log view session and reopen the file do a find for a subset of string *EZZ8431I PAGENT STARTING* and you should see these messages.

```

003414 0.0.0 port 22.
003415 main: EZZ8431I PAGENT STARTING
003416 main: Compiled on Sep 26 2016 at 18:37:59
003417 main: Use environment PAGENT_CONFIG_FILE = '/etc/pagent.conf'
003418 main: List all environment variables:
003419 main:   EXPORT '_CEE_ENVFILE_S=DD:STDENV'
003420 main:   EXPORT 'LIBPATH=/usr/lib:.'
003421 main:   EXPORT 'PAGENT_CONFIG_FILE=/etc/pagent.conf'
003422 main:   EXPORT 'PAGENT_LOG_FILE=SYSLOGD'
003423 main:   EXPORT 'TZ=EST5EDT'
003424 main:   EXPORT 'GSK_TRACE=0xFFFF'
003425 main: using code page 'IBM-1047'
003426 main: Using log level 511

```

- \_\_\_6. Do a find for the character string *TTLSSRule*, e.g. *f TTLSSRule* and you see multiple occurrences where the AT-TLS configuration elements added earlier are being processed.

```

```

\_\_\_7. Go the bottom of this file and you see these messages

```
EZD1579I PAGENT POLICIES ARE NOT ENABLED FOR TCPIP1 : TTLS
EZZ8771I PAGENT CONFIG POLICY PROCESSING COMPLETE FOR TCPIP1 : QOS
EZZ8771I PAGENT CONFIG POLICY PROCESSING COMPLETE FOR TCPIP1 : TTLS
EZD1586I PAGENT HAS INSTALLED ALL LOCAL POLICIES FOR TCPIP1
Finished main config file update
```

**Tech-Tip:** If a policy or otherwise changed the new or updated policy can be installed with an MVS modify command, ***F PAGENT,REFRESH.***

\_\_\_8. The policy agent is active. The policies have been loaded but there is one remaining step. The TCPIP stack has not been modified to enable TTLS. On this image this has been configure this way so the AT-TLS is disabled by default and must be explicitly enabled. This is done by an MVS VARY command,

***V TCPIP,,OBEY,SYS1.TCPPARMS(TTLS)***

Where the contents of SYS1.TCPPARMS(TTLS) is simply *TCPCONFIG TTLS*.

Issue this command and you should see these messages in the console.

```
V TCPIP,,OBEY,SYS1.TCPPARMS(TTLS)
EZZ0060I PROCESSING COMMAND: VARY TCPIP,,OBEY,SYS1.TCPPARMS(TTLS)
EZZ0300I OPENED OBEYFILE FILE 'SYS1.TCPPARMS(TTLS)'
EZZ0309I PROFILE PROCESSING BEGINNING FOR 'SYS1.TCPPARMS(TTLS)'
EZZ0316I PROFILE PROCESSING COMPLETE FOR FILE 'SYS1.TCPPARMS(TTLS)'
EZZ0053I COMMAND VARY OBEY COMPLETED SUCCESSFULLY
```

**Tech-Tip:** AT-TLS can be also be disabled with a VARY command, *V TCPIP,,OBEY,SYS1.TCPPARMS(NOTTLS)* where the contents of SYS1.TCPPARMS(NOTTLS) are *TCPCONFIG NOTTLS*

\_\_\_9. Stop and restart the server with MVS commands *P BAQSTRT* and *S BAQSTRT*.

**Tech-Tip:** The server must be stopped and restart because there is an active session between the zCEE server and IMS Connect. The policies are not trigger until the socket session is restarted.

***Test the TLS connection from the zCEE Server to IMS***

Now use the REST client to test the API with AT-TLS enabled.

- \_\_\_1. Open a DOS command prompt and change to directory *c:/z/admin*.
- \_\_\_2. Enter the cURL commands below:

```
c:\z\admin>curl -X get --cacert certauth.pem --cert user1.p12:secret --cert-type P12  
https://wg31.washington.ibm.com:9443/imdb/contact/LAST3
```

You should see the same results as before.

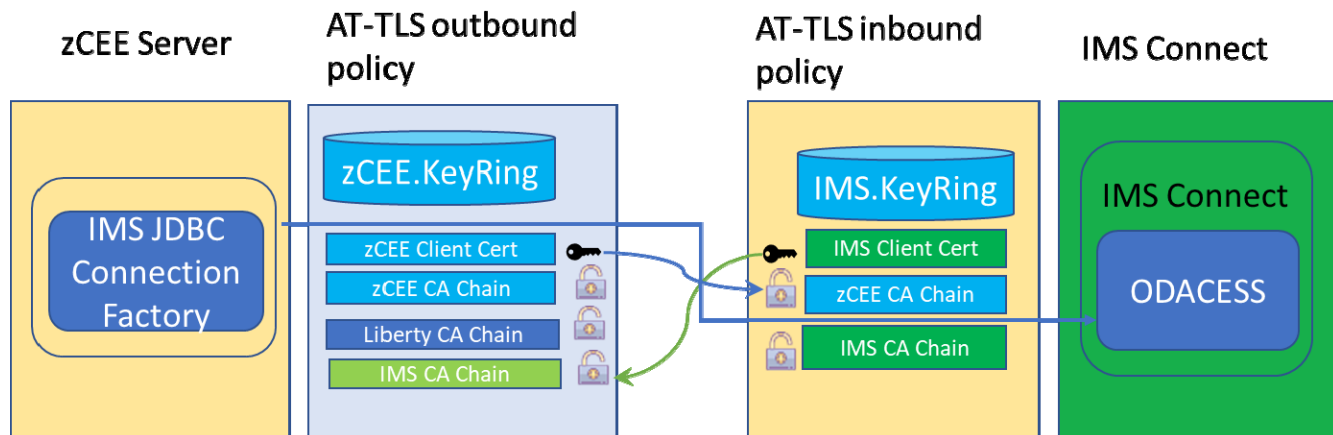

- \_\_\_3. View the *syslogd.log* file again and you should find the messages like the ones below. These messages are tracing the handshake between the outbound policy acting a client and the inbound policy acting as the server.

```
EZD1281I TTLS Map CONNID: 00000A35 LOCAL: 192.168.17.220..2693 REMOTE :  
192.168.17.220..5555 JOBNAME: BAQSTRT USERID: LIBSERV TYPE: OutBound STATUS:

2735 192.168.017.220  
HWSC0001I ODBD40D8 USER1 IVP15OOD RECV 424  
2693 192.168.017.220  
HWSC0001I TOTAL CLIENTS=2 RECV=2 READ=0 CONN=0 XMIT=0 OTHER=0
```

The diagram below shows the flow of the request from the z/OS Connect server to IMS Connect. The server and IMS Connect are unaware of the involvement of the AT-TLS the TLS handshake and the fact that the message is encrypted between the two endpoints.

5. There is information in the AT-TLS Knowledge Center for describing AT-TLS return codes (see URL [https://www.ibm.com/support/knowledgecenter/SSLTBW\\_2.4.0/com.ibm.zos.v2r4.hald001/comtls.htm](https://www.ibm.com/support/knowledgecenter/SSLTBW_2.4.0/com.ibm.zos.v2r4.hald001/comtls.htm)) For example, if the return code had been 202 it would be caused by the explanation below.

The key ring cannot be opened because the user does not have permission. Check the following items:

- Look at message EZD1281 to verify the user ID being used for this connection and the `TTLSEnvironmentAction` statement that is mapped to this connection. If you are configuring by using the IBM Configuration Assistant for z/OS® Communications Server, you can specify the key ring on either the AT-TLS: Image Level Settings panel or on each Traffic Descriptor.
- Ensure that the correct key ring is specified

This simply means the user does not have the required access to either of the RACF FACILITY resources `IRR.DIGTCERT.LIST` and `IRR.DIGTCERT.LISTING`

If the return code had been 414 and explanation can be found in the z/OS Cryptographic Services System SSL Programming (SC14-7495-40) manual or at URL  
[https://www.ibm.com/support/knowledgecenter/SSLTBW\\_2.4.0/com.ibm.zos.v2r4.gska100/ssl2msg1000885.htm](https://www.ibm.com/support/knowledgecenter/SSLTBW_2.4.0/com.ibm.zos.v2r4.gska100/ssl2msg1000885.htm)

#### **414 Certificate is not valid.**

**Explanation:** Either the local certificate or the peer certificate is not valid.

**User response:** Ensure that a valid certificate is being sent by the communication partner. Collect a System SSL trace containing a dump of the incorrect certificate and then contact your service representative if the error persists.

This is probably caused because the certificate authority certificate used to sign a server or personal certificate is not connect to the key ring. Or not properly connected to the key ring.

- \_\_\_6. The JCL in member *PASEARCH* in data set *USER1.ZCEE30.CNTL* can be used to display AT-TLS policies. Submit this job and see a display of the contents of the policy agent's configuration file. Without the Configuration Assistant provided by z/OSMF this file would need to be maintained manually.

```
//BPXBATCH EXEC PGM=BPXBATCH,REGION=8M
//STDOUT DD PATH='/tmp/paStd.out',
//          PATHOPTS=(OWRONLY,OCREAT),PATHMODE=SIRWXU
//STDERR DD PATH='/tmp/paStd.err',
//          PATHOPTS=(OWRONLY,OCREAT),PATHMODE=SIRWXU
//STDPARM DD *
SH echo pasearch -t | su
//COPY EXEC PGM=IKJEFT01,DYNAMNBR=300
//SYSTSPRT DD SYSOUT=*
//PASTDOUT DD PATH='/tmp/paStd.out',PATHDISP=(DELETE,DELETE)
//PASTDERR DD PATH='/tmp/paStd.err',PATHDISP=(DELETE,DELETE)
//STDOUT DD SYSOUT=*,DCB=(LRECL=1000,RECFM=V)
//STDERR DD SYSOUT=*,DCB=(LRECL=1000,RECFM=V)
//SYSPRINT DD SYSOUT=*
//SYSTSIN DD *
OCOPY INDD(PASTDERR) OUTDD(STDERR)
OCOPY INDD(PASTDOUT) OUTDD(STDOUT)
```

## **Optional**

Disable the use of RACF Passtickets and retest using only TLS and see what difference this makes.

## Summary

In this step you have created AT-TLS inbound and outbound policies which protect the IMS Connect ODBA port of 5555. These policies respectively act as client and server surrogates for the z/OS Connect server and IMS Connect.

## Appendix – AT-TLS Policy Agent Configuration File

```
